(uncompressed), it is a bit too slow to browse the web comfortably, and it has a per byte charge so it could get expensive too. It is lots cheaper than an Imarsat connection, however. There is a global network of stations operated by Globe Wireless, so you should have propagation to one or more of them at virtually any time of the day or night (the system automatically chooses the best frequency and shore station for you).

A satellite station (with omni antennas) can allow you to directly receive realtime weather imagery from the polar orbiting weather satellites, and of course you can *receive* HF WX FAX without any license at all. If you want to *talk* to people, however, you'll need a license. Barring satellite usage, the VHF+ privileges of the Tech license will only typically (there are exceptions) allow line of sight range voice contacts, so it isn't very useful in this regard while at sea. If you can find the time, learning Morse and getting a General Class amateur license is the most useful option. That'll allow you access to the 20m maritime nets where cruisers gather to chat on SSB voice.

There are a number of methods for learning Morse Code, none of them very quick or painless. Not everyone responds favorably to any given training technique. You'll have to try several methods to find one that works best for you. There is an audio tape course which some people find gets them to 5 WPM very quickly. It is called Code Quick. Unfortunately, its technique may cripple your ability to operate at faster speeds (it uses a mnemonic method which you'll have to *unlearn* to progress to 13 WPM). Some people find that easy to do, others find it virtually impossible.

Another method, which is incredibly boring but effective, is the Koch method of computer drill. The idea of this method is to condition a reflex response to each Morse character sound. That's vital if you are to develop any speed with Morse. You must be able to recognize the sound of each character as a *unit*, not as a combination of dots and dashes, if you are to gain speeds over about 10 WPM. That's because there isn't time to do a mental lookup conversion from dots and dashes to the characters at faster speeds. The Koch method is much like a touch typing drill. It is boring, boring, boring, but it works for many people.

(Boring is good when you're trying to condition a response. It decouples the conscious mind from what you are attempting to program the subconscious to do automatically. The key to being an effective wetware modem is *don't think*, just do. Let the lower brain functions handle it. Involving the consicous mind just slows you down.)

An HF enabled license is worthwhile to get if you are a cruiser, but it can take up a lot of time due to the Morse Code requirement. Figure that you'll need to devote at least 1/2 hour a day to drill for a few months to get it. (This varies wildly with the individual, you may pick it up quicker or slower. Some people *never* get it.)

You may actually find some *use* for Morse Code after you're licensed,
but you probably won't unless you happen to be one of those people
who actually like it and use it as a passtime.

There are a number of good equipment choices for shipboard use.
A good multipurpose HF choice is the SGC line of equipment. I'd
suggest that you become intimately familar with any radio equipment
you plan to use on the cruise *before* you leave. You should understand
its operation intimately, and understand its internal functions as
well. You may have to repair it at sea. Select an appropriate set
of spares and tools to allow you to do that. A complete *identical*
duplicate set of equipment is a good idea if you can swing it. If
the equipment design is modular, that'll allow you to easily make a
working set of equipment even if both units suffer failures. It is
unlikely that both will suffer identical failures, but study of the
equipment design can alert you to probable areas of common failure
and allow you to stock parts to deal with those, IE carrying a set
of spare PA transistors may be worthwhile.

The most likely failures on shipboard will be because of dirty power,
lightning strikes, and the salt water environment. You'll want to
pay some attention to conditioning power for your radio equipment
to guard against damage due to dirty power. You'll want to take
steps to protect the equipment in the event of a lightning strike.
And you'll want to choose equipment which is designed to tolerate
the marine enviroment, IE Ten-Tec equipment is a poor choice due
to the corrosion prone interconnect wiring it uses. Look for all
gold flashed interconnects. If you'll be sailing tropical waters,
look for a fungus-proof conformal coating on the circuit boards.
Etc.

Americans, I fear for you and I.

Please do me a favor, pick up a book called "World Orders, Old and New", by Noam Chomsky. Thanks.

If you knew what the future was bringing, you would get a gun and baracade yourself in your house from the government. Our freedom is deeply in trouble. Greed is what's running this country(as if you havent noticed yet), and those whose lives arent "productive means" to the rich, are going to be removed or enslaved.

The government is purposely being lenient on criminals and letting them out of jail so they cause more tension in society which gives the government a reason to stomp down and cast more laws giving them more control over us. And the fear generated causes us to separate from each other more and more. The court systems have purposely been flawed, this was planned years ago. Believe it?

The plan entails severing the people using media(press, tv, radio, newspapers) and creating extreme tension between the races of which there eventually is going to be a major riot, or revolution. They know by letting criminals out on "technicalities" they will re-commit the crimes they previously had, and this will build up, the general public will become extremely fearful, and the general public allows their rights to be retracted by the government thinking that the laws that they cast will bind the criminals, which clearly will not. The laws have only one purpose, to get you to a point where you cannot defend yourself when the government wants to take direct control over your life. Where you go, what you do, when you do it, and if they can what you believe. Believe me? Please, for your sake, do....

How could you not? Look at technology, how it has skyrocketed. Now why has'nt society healed, why hasnt the government used what they know to heal those who cant heal themselves? Because its not profitable.

Are there ethics to dominating those who cannot assume a profitable life?
Should the rich man care about the poor man? DOES HE? Look at our society and there is your answer.

Those who could not excel in school, and achieve a high academic standing, are the ones the government doesnt care about. They will not be "Profitable entitys to ANYONE", so the government doesnt care about them, and quite frankly see's them as a hinderance. They bogg the

profitable machine, and are a hassle to the rich corporate leaders(who are the government)who only want to see themselves get more money than their corporate buddy next to him. But what about the guy who didnt get the college education to get the high paying job, the guy who doesnt want to hurt anyone. Couldnt they sacrafice just a little of their massive incomes to give a little more money to the lower guy on the totem pole?

I would think if they believed in GOD they would. Ethically it would be the right thing to do to give $10,000 more a year to the guy that makes $20,000 dollars a year. But that $10,000 has to come off of his $1,004,000 a year, and that would maybe cost him a vacation out of the 3 he takes a year. See what I mean about ethics, if their were some, these guys wouldnt be doing what they have been doing to the middle class.

These corporate leaders(government) quite frankly I have found don't believe in GOD, in any form such as I could see. They firmly believe that their profits make them SUPERIOR, and they should have control of the world. If you are not profitable in your life to someone, some corporation, some business, you eventually will not have a place in this world. The Corporate Structure, will have so many laws in place, that you will not be able to move without permission. Believe it? Please start. Its happening.

Population control. A highly desired element of these industry leaders. All of the post WWII wars were population control wars. Look at them, you know its true. Think about it. Korea? Viet Nam? Why?

How can the average American citizen have absolute proof that we need to be engaged in combat to protect "our interest's" (which are corporate interests, a possible threat to their profits)? We cant, and the "High Elite" don't want us to be capable of that. Shit, we wouldnt fight if we knew that it wasnt right to be in battle just for someones profitable interests. It wouldnt really be ethical, would it?

Anyways, I could go on and on, but if you want hardcore proof, read this book, it's hot off the presses, and I wouldnt be suprised if Noam Chomsky life is soon in danger.

Again, "World Orders, Old and New", by Noam Chomsky. He is a professor at MIT(Massachusettes Institute of Technology). Do yourself two favors, read this book, and be nice to someone you wanted to be mean to.

You can go from zero to Extra in one sitting if you like. The quickest
way to get licensed is to take the Tech exam while you are still brushing
up on your code. Once you're licensed, you can take advantage of the
"instant upgrade" provision of the rules to immediately use any new
privileges you gain by taking the upgrade exam. You don't have to wait
for new paperwork to arrive from the FCC.

>2)There must be some good shareware out there for learning/practicing for

>OK or is there something better out there?

There are a number of good drill programs available. SuperMorse and
Morse Academy are both popular programs. Make sure any program you
choose will allow Koch method drill. For the written, I'm old fashioned
enough to think that simply reading and understanding the required
material is the best course. Get a copy of Part 97, and a good theory
text, and place them in the reading room. Read them, understand them.
Then the written will be a breeze. (It's a lot easier to understand
the principles of theory than it is to memorize test answers, and a
lot more useful too.)

>I maybe be better off with 2 separate transceivers?

Maybe three, or four, or five. :-)

The IC-706 packs a lot in a very small package, but because of that
there are a number of compromises. It is not a bad choice, and in fact
is the *only* choice if you want HF and 2m in the same compact package.
But you can certainly do better by choosing separate radios, each optimized
for its intended function. In many areas today, you really want both
2m and 70cm capability, and more power than the 10 watts the IC-706
puts out on 2m is also very worthwhile. And you are likely to want to
monitor a favorite repeater while fooling around on HF, so a separate
radio is a necessity for that. Thus you may want a traditional dualbander
for VHF/UHF in addition to a HF rig. (You may want a VHF/UHF multimode
if you think you might want to work amateur satellites.)

The IC-706 is a pretty good little HF rig, especially for mobile operation,
but compromises in performance had to be made to get it that small. The
receiver isn't as robust against strong signal overload as some other HF
rigs, and the filtering isn't as tight as with some other rigs either.
Transmitter performance is adequate (most transmitters are adequate,
SSB/FM transmission isn't rocket science), but it is the quality of the
receiver which makes or breaks a radio. Yaesu currently makes the best
HF radio receivers.

Now don't get me wrong, I *like* the IC-706. I've owned one for a
year and don't intend to get rid of it. But I also wouldn't choose
it as my main or only radio unless space or funds were an overriding
concern. It'll certainly *do* as your only rig, but I predict you'll
eventually want something else to augment it.

>b)Antenna(s):Yikes, what do I get and where do I put it? I could stick a

>poor. I am assuming I would have an antenna switch to go from antenna 1 to
>antenna 2 to dummy load to ground to make my life easier. Do most modern
>transceivers automatically match impedance to the antenna?

Ah, antennas, that's a debate which can last a lifetime (and is a large
and complex enough topic that it has its own newsgroup). Certainly
you'll be best to go with outside antennas if possible. They'll almost

always perform better. A vertical usually isn't the best choice for HF. You need a really superior ground radial system to exploit the characteristics of the vertical, and they are more susceptable to manmade noise pickup than a horizontally polarized antenna too. (Note, verticals are often the best choice for VHF/UHF, that's a separate topic.)

I'd suggest you start out with simple wire antennas. They're cheap, and work very well if mounted high and in the clear. You can use resonant dipoles for each band, but there are multiband options as well. The G5RV style antenna has found favor lately, but it involves some compromises to allow coax feed. A better choice is an ordinary flattop fed all the way back to the station by ladder line. A length of 105 feet works well with available balanced tuners from 80m to 10m, though the flattop length isn't particualarly critical. Use of a yagi beam on a tower for 20m thru 10m will perform better on those bands (a quad can work well too), but the wire antenna will suffice. You can also use a trap dipole, and direct coax feed. That has pluses and minuses too.

Many modern radios have built in autotuners, though many do not. These are generally of very limited matching range, however, and are only to tweak up a match to an antenna which already basically offers the right impedance. Especially if you choose a multiband wire antenna, you'll want an external antenna tuner. There are some automatic tuners available for that, but a plain old manual tuner does just fine. One that handles balanced lines properly is the best choice. (This can become a very involved topic for such a simple piece of equipment, and depends to a large degree on the type of antenna and feed system you choose.)

>c)Money: I do not mind spending extra if it is going to make a difference.
>I am torn between going really basic on equipment and trying to get started
>for about $500 or spending $1500 (MAYBE $2000) for EVERYTHING to get a
>really nice serious setup. I figure my computer cost me more than that and
>in 3 or 4 years it's worthless while good amateur radio equipment should
>last me a while. I just want to do it right the first time which is why I'm
>posting this long request for experienced advice.

I don't think there is such a thing as the perfect setup, and if there is, it certainly changes from year to year. I don't recomend starting out with very basic equipment. You're likely to be disappointed, and frankly, use of very basic equipment requires more skill in order to be effective than you are likely to have when just starting out. Buy good solid performing equipment and expect to change your mind several times over the next few years. Radios are not like PCs, there are no generic solutions.

Most amateurs go through a number of rigs before they find one that suits them (some amateurs are perpetual traders, who never settle on one rig). The used equipment market is a definite possibility. You can buy a used rig, play with it a while, and if you don't like it you can

resell it for nearly what you paid for it. You can't do that with new equipment. It takes a serious depreciation hit the moment you take it out of the box. (Again this is a large topic, and a newsgroup is devoted to it.)

>4)Miscellaneous silly questions:
>a)Since I have a computer the possibilities of linking it with amateur
>radio intrigue me. What are the possibilities? I have read a little about
>RTTY and packet radio but I do not yet understand how they work in
>practice. Any explanation of how computers and radio can be used together
>is welcome.

This is also a large subject (which has its own newsgroup). Modern digital signaling offers huge advantages to the amateur over traditional methods. There is a large and confusing alphabet soup of different systems available. On HF, you'll find RTTY, packet, PACTOR (and PACTOR II), AMTOR, GTOR, and Clover (my favorite). These will all work through ordinary SSB grade HF radios (and in some cases even simpler radios).

On VHF/UHF there is primarly just packet, but it comes in a bewildering number of flavors, from basic AFSK over FM 1200 baud to MSK 56 kilobaud systems. Then there are the PSK satellite packet systems. Many choices, and different radios required to utilize them effectively. Aside from simple 1200 baud basic packet, you need something other than a voice grade FM radio to use them effectively. Many try to use voice grade FM radios for 9600 baud, but are disappointed by the poor performance. And beware of voice grade radios claiming to be "9600 baud ready", they aren't, its just marketing hype. You need a data radio to do higher speed packet effectively. Fortunately, these aren't complex or expensive (often cheaper than FM voice radios).

There is also a bewildering array of software to utilize these digital systems. Fortunately, almost all of it works on an ordinary PC, and most of it is either freeware or shareware.

>b)sidepaddles: I read somewhere that these allow you to execute perfect
>dits and dahs, any comments?

They do, but it takes some skill to master them. I suggest that if you are going to operate Morse, you start out with a straight key and learn to send properly before fooling with these things. You've got to know, intimately and unconsiously, what good Morse sounds like before you can use a keyer effectively.

>c)amateur television: I have also read blips about receiving/transmitting
>television over amateur radio frequencies. What extra equipment would this
>require and how does it work?

There are two systems in amateur use (three if you count slow scan TV). The most commonly used system operates on the low end of 70cm. It is ordinary VSB AM TV sent in the same manner as broadcast TV. There are a lot of drawbacks to this system (which is why broadcasters are finally abandoning it), but you can use a "cable ready" TV set as a receiver.

Correct transmission requires a very linear AM modulator and amplifiers, and a sharp VSB filter. Few amateurs manage to transmit it correctly.

A much better system is FM TV. This is normally done on the bands above 70cm. It is similar to systems used professionally for terrestrial relay and for satellite TV transmission. The equipment is easier to get to perform correctly, and the FM threshold offers pictures which are more noise immune. A separate receiver is required to bring it down to baseband where you can watch it on your TV or monitor. The transmitters and receivers are simple, and almost always work well.

I mentioned SSTV. That's used primarily on HF. It converts the picture into a series of varying frequency tones which are sent over a SSB radio. The resolution isn't great, and the frame rate is low (about 8 seconds per frame for the basic system), but it works over global distances.

In the near future, a fourth option may become available. That's digital TV transmission. Broadcast is switching to this method, and amateurs can too. Currently there isn't any commercially available equipment for amateurs to use, but this is a fertile area for the experimenter.

>Many thanks to those who take the time to respond. I know this is a
>long-winded information request but I really want to do this right the
>first time instead of stumbling my way through like an idiot.

We all stumbled our way through like idiots when we started out, Eric. Dom't be embarrassed about that. It is part of the normal learning process. That's one of the primary purposes of amateur radio, to learn about radio communications systems by experimenting with them in a hands-on manner. Hopefully, you'll spend a lifetime stumbling along learning about the myriad ways radio can be used for communications. That's why we're here, it's what we do.

> most organisations, clubs, publications, et al, have/are also
> experenced/ing such problems. A well-hackneyed phrase I admit, but it
> appears to be symptomatic of the times?

It may be true of the world of radio, but in general membership responds
to what it sees as benefits. I'm involved with the UK Audi quattro
Owners Club, and our membership has grown 30% in each of the last three
years.

People will only join a club or renew membership if they see a benefit.
Unfortunately, it's easy for those who see power as an end in itself to
hang on to it for too long - and many such organisations have suffered
as a result. We had an _awful_ time ousting an egomaniac from the UK
Computer Measurement Group, and it jst about killed the organisation.

3602. PC PackRatt v2.0

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-15 00:00:00 UTC
From: bcl2@aol.com
Message-ID: <19970215121401.HAA07190@ladder01.news.aol.com>
Source record: 204575

I just reinstalled PC PacRatt v2.0 on my computer, for packet radio use. When I get the initial screens that allow configuration of the system, the values entered are not stored and the display screen that eventually comes up, has cut off the lower portion of the menu bar. I have used this program successfully on this computer before, but had taken it off the computer hard drive for a period of time. The computer has no other problems running other programs.

Unfortunately, when I tried to contact AEA, they are in the process of being sold/acquired and could not answer any technical questions.

Anyone with advice or similar experience?

Thanks for any help,

Dave KG0JL

All you defenders and attackers will appreciate this:

Did you know that the Lambda Club has now given their name to a new receiver design?

Actually it is an OLD receiver design that they have re-discovered!
Back in the late 50s when the military was going whole hog for SSB there was a paper by John Costas of G.E. suggesting maybe that wasn't the wisest thing to do.

And that paper is:

Costas, John P., "Synchronous Communications," Proceedings of the IRE, December 1956, pp. 1713-1718

The receiver he described was a direct-conversion, or "HOMODYNE" that contained a PLL circuit that we now know as the Costas Loop.

So just remember that the PLL circuit in your radio transceivers USED to originally be called a "Homodyne."

(Runs and ducks for cover!!!)

Actually, US bombing tactics often were ineffective. The Brits would press in low and slow to assure hitting the correct target, and that was incredibly hazardous (so much so that the Brits had to switch exclusively to night attacks for strategic bombing), while the US tactic was high altitude bombing, which tended to strew bombs over a broad area (that was hazardous too, due to enemy fighter action of course). The 8th Air Force finally made that work (thanks to technical marvels like the Norden bombsight), but it was mostly useful against dispersed civilian targets, like cities, or industrial facilities, rather than as a direct combat action against enemy forces.

(Strategic bombing of enemy cities probably had little effect on the outcome of the war in Europe. German military production climbed every year of the war despite round the clock strategic bombing. And strategic bombing only served to stiffen the resolve of the German people, and that of the British people for that matter.)

When close air support was needed, troops on the ground were always glad when the Brits showed up rather than the Americans because they'd get right down in the mud with the troops to make sure they hit the right guys. We got better later in the war, by 45 we'd gotten deadly accurate at close air support. And particularly in the Pacific, our Navy and Marine pilots really pressed home their attacks. They made a reality out of the concept of aerial artillery support (and paid a huge price in casualties doing it).

This was the real value of bombing in WWII, aside from the A bomb attacks on Japan, of course. Those strategic attacks did serve to break the will of the Japanese in a way that things like the firebombing

of Dresden did not, even though the latter killed more civilians and caused more property damage. The A bomb was the ultimate terror weapon, dropping from a clear sky to obliterate a city with no warning and no chance to fight back.

Gary is sorta misinformed. A majority of scrambled comms are encrypted digitally. There are NO after market devices available to the casual listener to eavesdrop on such.

all these types of systems change there keys on a regular basis. And there are ALOT of combo's ALOT. so the chance of you finding it would be remote.

I have yet to see anyone "crack" the DVP systems in use today. Voice inversion type of comms YES but not many in use by serious law enforcement groups today.

3609. Vanity/Historic Club Call K0AIR Assigned in Record Time!

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-15 00:00:00 UTC
From: pschleck@oasis.novia.net
Message-ID: <5e4i7i$4gc@oasis.novia.net>
Source record: 204582
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.policy,soc.veterans,alt.military.cadet,sci.military

I had to do a double-take when I saw this one already on the FCC Amateur Radio callsign database at http://www.qrz.com/:

Callsign: K0AIR
Club Name: STRATEGIC AIR COMMAND MEMORIAL ARC
Addr1: 11510 S 39TH ST APT 4
Addr2: BELLEVUE NE 68123
Country: USA
Effective: 12 Feb 1997
Expires: 12 Feb 2007
Trustee: PAUL W SCHLECK K3FU
Location: 41.294 N 96.000 W Sarpy County
Email: pschleck@novia.net

(The FCC doesn't track E-mail addresses, this was added by me via manual registration at the QRZ web site.)

Considering that our FCC Form 610-V was sent U.S. Mail just a scant 2 weeks prior, this is very impressive turnaround (particularly in light of the fact that processing had been on hold until just a few days ago, and the FCC has at least a thousand Works in Progress or WIPS applications, usually as a result of applicant errors, that they were working on first). This may prove the point that *correctly* and *legibly* filling out the 610-V, and doing appropriate research on the callsign(s) you want, may have a strong influence on bubbling your application to the top of the stack.

Oh by the way, with regard to the above club call, this represents a collaborative effort among members of the local amateur radio club (Bellevue ARC) and local SAC-related historical organizations, and not just the effort of one person. K0AIR was a military-recreation station assigned to Offutt AFB, with a distinctive and recognizable USAF-oriented suffix. It (along with K[1-9]AIR at other installations) was active at as recently as the early 1960's, but unfortunately has long-since expired. Recent reinstatement by the FCC of new club amateur radio station licenses, and a new "vanity" program to apply for specific callsigns, motivated some of us to try and recover it. I was asked to serve as trustee partially because recovery of the "AIR" call was my idea, partially because I'm an Extra-class operator (which means that the privileges of any guest operator at K0AIR will never exceed mine). It is a legitimate club which should be incorporated and accepting memberships shortly. I'm working on an Internet mailing list for members and other interested parties. Please drop me some E-mail if you'd like to join the list once it is created.

Much thanks go to the ARRL and the FCC for working together to reinstate
new club licenses, as well as recovery of historic callsigns under the
new vanity program.

I hope everyone understands this is against FCC regulations. Amateur tranceivers are not TYPE ACCEPTED for this service. There are reasons for this. I take it no out of amateur band transmissions will be made until a bonfide life and death situation occurs.

You should not publically admit to federal offenses. You admissions are being permanently recorded in archives like DejaNews.

This sounds like a unit produced about 10 years ago, and was originally
used at 5.5 to 6.5 Mhz split. Is there a part number on it?

>, or has one for sale,

I can't really help with finding you one as we are a bit far apart, but
I can probably get the specifications for it if it helps.

> please let me know. Also I was
>told that there is a four cavity model which will work also.

Yes , if its the one I'm thinking of, it was just two of the same
cavitys in each leg. I seem to remember that the insertion loss was
quite a bit more, but the isolation wasn't that much better.

In practice, the newer design of Duplexor is better and only costs about
120 UKP 80 USD, so the square cavities are NLA. / certainly in the UK /

> Does anyone know of a mod to make the Realistic HTX-212 transmit out
> of band??? I want to be able to use this radio on my boat on the
> marine band instead of buying another radio.

Have you looked on the QRZ Website? I've found quite a few mods there.

Now, as an answer to some of the complaints you're receiving about the pros and cons of amateur radios having the capability to transmit out of band-

I am a career firefighter. I work in a <paid> department, and do it for a living. I'm not some yahoo volunteer out to make a name for myself by doing stupid things. (Yeah right, like going into a burning building while others are coming out isn't stupid, but hey, somebody has to do it!) When I got my amateur license, it was then that I found out that certain ham radios could be modified to work out-of-band. At the time, our department was stiffed for funds, and occasionally, some of us would be inside a burning building with no way to communicate with the outside (lack of radios). It was a godsend that I obtained permission from our department's chief to use my amateur HT and mobile to transmit on the fire department frequencies! He understood the EMERGENCY nature of my use, and consented without me even having to use my cattle prod! I've also used my mobile rig when I was off-duty to call the F.D. Dispatcher and inform them of auto accidents that may have gone unreported for long periods of time. Or to let them know that no emergency response was necessary, saving the wear and tear on our engines. At $700 per run, it adds up. Yes, all things considered, it costs about $700 to put a fire truck in the street for EACH CALL! And since we run first-responder medical as well as fire calls, and ran over 5000 calls last year- well, you get the picture. I've only used my mobile to call in accidents four times in 5 years. It's not like I abuse it. I don't call the dispatcher to ask what time it is- it's ONLY FOR EMERGENCIES! If this fellow wants to use his radio in a like manner, WHO CARES!?!? Our department now has more radios, and I no longer must carry my HT into fires. It is my opinion that my use of my amateur HT/mobile on frequencies AUTHORIZED by my department probably saved time, money, and lives. How can you argue with success? 73, Web Williams, KR4WM, City of Myrtle Beach Fire Department, Myrtle Beach, SC

THe FCC, with all their people and funds is now searching the DejaNews
archives to find out who has admitted to federal offenses. They will
then go before an OJ Simpson kind of Grand Jury and get a warrrant for
arrest. The FCC will get a plane ticket and show up to your door and
confront you with your e-mail admission. They will search your house and
confiscate your radios and computers. So make sure not to admit to
violating out of band rules!

3620. Re: FCC ISP Access Fees

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-15 00:00:00 UTC
From: clint.bradford@atdbbs.com
Message-ID: <970215085923110 18@atdbbs.com>
Source record: 204593

The following is the LATEST, BEST-AVAILABLE INFORMATION on this topic...derived from Association of Online Professionals' Chairman Dave McClure and I discussing the issue DIRECTLY with the appropriate FCC representatives on February 12/13, 1997:

```
============================================================
Comments to FCC on ISP Access Fees
============================================================
```

Over the past week, message traffic across the Internet has incorrectly characterized the procedures, deadlines and general tone of an FCC request for comments on access fee reform as it might apply to Internet Service Providers.

This is an important issue for the online community, and AOP encourages ISPs and other interested parties to file comments. The following information is intended to assist you in doing so.

On December 23, the FCC initiated a proceeding to reform the present system of interstate access charges levied on long-distance carriers to make that system more competitive and to address questions of whether these fees reflect the actual cost to the local telephone companies. This proceeding, in a Notice of Proposed Rulemaking (NPRM) is identified as CC Docket No. 96-262. Formal comments were invited, with a deadline of January 27 and a deadline for reply comments of February 13.

This is **not** where ISPs should focus their responses, unless they have valid input to these specific telephone company issues. However, many of the comments filed on this issue do touch on ISP access fees, and you are encouraged to read the comments that have been posted online at http://www.fcc.gov/Bureaus/Common_Carrier/Comments/access_reform/.

Also on December 23, the FCC released a Notice of Inquiry (NOI) identified ad CC Docket No. 96-263. In the NPRM (see above), the FCC tentatively concluded that information service providers should not be subject to the interstate access charges as currently charged. However, the Commission also noted that the development of the Internet may raise issues beyond the scope of the access fee reform proposed in the NPRM. The NOI is designed to help the FCC decide whether access fees may be needed to create incentives for the deployment of more efficient data services.

AOP encourages all of its members to file appropriate comments with the FCC on this issue. In doing so, please be aware of the following:

1) You may file formal comments in writing, as AOP will do.
2) You may file informal comments by electronic mail by sending them to isp@fcc.gov. However, please note that "informal comments" does not mean "casual." It means "less formal than written comments," but there are still requirements for the format (e.g., putting the docket number in the subject line, providing a mailing address, etc.). Before filing comments, please review the information at http://www.fcc.gov/isp.html.
3) Deadline for these comments is March 24, 1997. Reply comments to these comments must be filed by April 23, 1997. Note that these are **new** filing deadlines, amended by FCC to provide more time for responses.

Before filing comments, you are strongly urged to review:

** The general information on filing comments with the FCC, found at http://www.fcc.gov/isp.html.
** The text of the NOI itself, which may be found at the same web address.
** Comments previously filed by other parties as part of their response to the NPRM.

This is an important topic before the FCC, and we encourage you to make thoughtful, informed comments. AOP will post its comments shortly for the review of our members.

I am looking for a service manual for a Kenwood TR-7400 and one for a TR-8400 so that I can align both of my radios. I will pay reasonable copy and mailing costs. Please contact me via email at: gerwitz@inficad.com

Thank You.

Jim

Greater Baltimore Hamboree and ComputerFest
Host to the ARRL Maryland State Convention
April 5-6, 1997
Maryland State Fairgrounds, Timonium Maryland

COMMERCIAL DISPLAY SPACES are located in the exhibition hall and the Home Arts buildings. Each space measures 8 feet wide by 10 feet deep, is tastefully appointed with pipe and drape curtains, company sign and covered 8 foot table. Electricity, 120 volts only, is available. Vehicle access to the building for unloading and loading is available on a first come, first serve basis, subject to safety regulations. Vendors may order lunch to be delivered to your booth during the show. A caterer's representative will visit your booth before lunch and take your order and payment. Each person in your staff will be provided Exhibitor passes (up to four passes per space). The cost, just $150 for one space, $275 for two spaces and $370 for three spaces. Additional spaces are just $75 each. Spaces must be reserved in advance using the Space reservations Form. The mailing deadline for advance reservations is February 7, 1997. Last year the entire Commercial display Area was SOLD OUT.

ELECTRONIC INDOOR FLEA MARKET SPACES are located in the Cow Palace. Each space is approximately 8 by 8 feet and includes an 8 foot table. Admission for one person per space is included with your space. Additional reduced price admissions good for both days are available for $8 only when you make your reservation. Each person must have an admission ticket for enterance. Limited 120 volt electricity is available. Vehicle access to the building for unloading and loading is NOT PERMITTED. The cost for the weekend, just $40 per space. A discount of $5 per space is available for 10 or more spaces ordered on the same reservation. Spaces must be reserved in advance using the Space reservations Form. The mailing deadline for advance reservations is February 7, 1997. Last year the entire Electronic Flea Market Area was SOLD OUT.

PREMIUM INDOOR TAILGATING SPACES are located in the Cow Palace, North section. Each space is indoors, out of the weather, and large enough to park one car, van or small trailer. Due to space limitations, no oversized vehicles can be permitted. No electricity is available and no generators are permitted. The cost, just $10 per space per day. With advance registration only, the cost for both days is just $18. No SUNDAY ONLY reservations will be accepted. Spaces are numbered and will be assigned as we receive your reservation request. To reserve the same location as last year, submit your order by Jan 31, 1997 and indicate your requested location. The cost for Premium

Indoor Tailgating space is in addition to established admission prices. Use the Space Reservations Form to reserve your space and admission tickets. The mailing deadline for advance registrations is March 29, 1997. Orders received after March 30 will be held at the Timonium Road gate for pickup. Any unsold spaces will go on sale at 6:00 PM Friday April 4 at the Timonium Rd Gate. Last year, the Premium Indoor Tailgate spaces were completely SOLD OUT.

OUTDOOR TAILGATING SPACES are located on the 5 acre "Midway". Each space is approximately 10 feet by 20 feet. No electricity is available . The cost, just $5 per space per day. With advance registration only, the cost for both days is just $8. No SUNDAY ONLY reservations will be accepted. Spaces will be assigned as we receive your reservation request. The cost for Outdoor Tailgating space is in addition to established admission prices. Use the Space Reservations Form to reserve your space and purchase admission tickets. The mailing deadline for advance registrations is March 29, 1997. Any unsold spaces will go on sale at 6:00 PM Friday April 4 at the Timonium Rd Gate. Last year, the Outdoor Tailgate spaces were completely SOLD OUT. Outdoor spaces are first come first serve.

ENTRY TO FAIRGROUNDS: All vendors must have an admission ticket(s) or pass(es) and have them ready to show at the gate. Vendors must enter the fairgrounds via the Timonium Road Gate. Use I-83 exit 17. Take Padonia Rd east to York Rd., go south (right) to Timonium Rd., then west (right) to the Vendors gate, just before the railroad track. No vendors will be admitted before 6:00 PM Friday evening.

Parking and Traffic Information

Getting there: Take I-695 to I-83 North. Take I-83 to Padonia Rd East. Take the first Right for Deerco Rd and the park and ride lot, or go east to York Rd, turn right, and go to the York Road gate.

Best bets for parking: The Park and Ride lot off Deerco Rd, to the west of the fairgrounds.
Also, the Timonium Rd gate has some parking available. But the best bet is to use the Light Rail to get to the fairgrounds.

Maps are available on our web page at http://www.concentric.net/~gbhc

See you there!! (Talk-in on W3FT 146.67- Repeater)

Advance General Admission Ticket Sales Information

Avoid Ticket Sales lines. Order your weekend passes for only $8 per person for both days. Include a Self Addressed Stamped Envelop with your order. Use the Space Reservations Form to reserve your admission tickets. The mailing deadline for advance registrations is March 15, 1997.
****
****Include a Self Addressed Stamped Envelop with your order. ****

Maryland State Convention

Agenda

The ARRL Maryland State Convention is held in conjunction with the GBH&C. Forums begin at 9 AM.

Don't forget to get your tickets for the banquet on Saturday night. $19/Person.

Sessions (Saturday):

9 AM: Pictures from space
10 AM: Bob Bruninga WB4APR, APRS (Automated Position Reporting System)
11 AM: FCC Forum
12 PM: ARRL Forum, Kay Craigie WT3P, Bernie Fuller N3EFN
1 PM: Steve Ford, WB8IMY, from ARRL, will be talking on Phase 3D satellite.
2 PM: TBA

Don't forget to get your tickets for the banquet on Saturday night.

Banquet Menu:
Shrimp Scampi, Fetticcini Noodles, Prime Eye Round & Herb Roasted Turkey Breast carved to order, Red Bliss Parsley Potatoes, Cauliflower, Broccoli Florets with Carrots, Assorted Dessert Table, Coffee, Tea, Beer, Wine, Whiskey Sours and Soda for only $19 per person.

Ham Radio License Testing Session

Testing will be conducted on Sunday April 6th by the Hanover Area Hamming Association, ARRL VEC, Registration will start at 9:00 A.M. in the Vista Room, located in the upstars of the Administration Building. The Aministration Building is located next to the Exhibition Hall.

Pre-registration is requested. Walk-ins will be accepted. Testing will start promptly at 9:30 A.M. Nobody will be allowed in after 9:30 A.M. The ARRL fee of $6.25 (effective 1/1/97) will be in effect. Those who pre-register will be seated first. To pre-register please send a completed form 610 with a copy of your current license (if any) and a copy of any CSCE's (if any) to VE Testing, P.O. Box 95, Timonium, MD 21094-0095.

You will need to bring any originals (license and CSCE's) along with proper ID and $6.25 to the exam site on the 6th.

Hotel Accommodations Information

The host hotel for the 1997 Greater Baltimore Hamboree and Computerfest and the ARRL Maryland State Convention is the Holiday Inn Select, Timonium. The Holiday Inn Select, convenient to the

fairgrounds, is located at I-83, Exit 16. Enter the hotel by way of Greenspring Road. Special rates are available for show attendees. You must mention you are attending the Hamboree to receive the special rate. Reservations must be made by calling the Holiday Inn Select directly at 410-252-7373.

Next YEAR: March 28-29, 1998
Maryland State Fairgrounds, Timonium, Maryland

Our web page will be updated in late April, 1997 for Next Year's Show dates, March 28-29, 1998

Baton Rouge, La.

Three years after setting up this station here in Baton Rouge, I've been transferred to FLa. I really would like to leave the antenna system intact when the house is sold, but if I have to, I'll sell it seperately or take it with me.

This is a charming 3Br/2Ba 1670 sq. ft. brick home on a 110' X 150' lot in an established subdivision which has NO ANTENNA RESTRICTIONS. The house was built in 1960, was completely remodeled three years ago, has a chain linked fenced back yard, 4 huge and beautiful "Live Oak" trees (2 in the front and 2 in the back), and is 2 blocks from the elementary school. With the property valued at $85,000, the taxes last year were $61.00.

The Antenna System consists of: Commercial grade extreme duty aluminum 80' self supporting motorized crank up tower which I had custom built. This is a triangular tower measuring 36" per side at the base. Rotor is a Yaesu variable speed G1000SDX. 15' of $10/ft. extreme heavy wall mast puts the KT34XA KLM beam (2 years old, had a mosely PRO67B up for first year) at about 92'. 10' below that is the Cushcraft "Skywalker" 2 element 40 meter beam (also 2 years old). An Ameritron five position switch box at the 40' level directs the 5 element 80 meter half wave sloper array (f to b ratio confirmed many times by DX stations to be at least 20db.) At the 80' level is a 13 element Cushcraft 2 meter beam on a seperate side mounted rotor. All coax (mil spec RG213) and other cabling is neatly bundled and enters the shack via the attic and internally through the inside of the walls. The ground system consists of 2,800 feet of #4 bare copper wire buried 6" deep in a grid with 10' centers throughout the entire yard. (the neighbors REALLY knew I was a lunitic when they saw me putting it in) All junctions are soldered...and the whole thing is tied to four 8' ground rods under the 6' deep tower foundation(6' X 6' X 6' of 4000lb psi peagravel concrete with 180 lbs of tied rebar), four ground rods at the far corners, and 2 rods on the sides of the house. I put this station on the air in Jan '93, and since that time I have compiled in leisure time 302 countries confirmed (all bands), 5 Band DXCC (plaque dated March 27, 1995), 216 confirmed on 40 meters, and 186 on 80 meters. Last year I strung up a 160 meter inverted vee for 2 week ends and won CQ 160 meter phone contest for the state of Louisiana.

The rest of the station which I'm taking with me regardless, is a Kenwood TS950SDX, Ameritron AL-1500, and several hundred pounds of various other junk.

The price for this very nice home with all antenna equipment mentioned above is $84,900.00. I might point out that property values in this part of the country are quite low compared to most of the rest of the country....as are the taxes. La. has a $75,000 "Homestead" Exemption, which means that the first $75,000 of a home's value is tax free.

The antenna System alone is $5,000.00 (I've got almost $9,000 in it) I'll take it down, you ship or haul it off.

Gary,

What you say may hold true today, but it in years past it had more to do with hams who were ARRL Official Observers's "monitoring" for "violations" and then sending out those fameous "OO Cards" to those who did a non-no. Also in days of yore, we had a responsive FCC that pounced on any timy violation with long unilateral suspensons or revocations of ham licenses -- based on investigations from complaints filed to them by OO's and other hams.

Up to about fifteen years ago, the OO's were nick-named the "ham radio police" and they were respected and feared. In the '70's -- with the popularization of VHF-FM and repeaters, and a brand new style of party-line operation; the reciept of an OO card by a poor operator on a repeater quickly became a "badge of pride." The OO's also began facing new civil rights laws -- primerally coming from a liberal congress that

was bent on protecting the guilty at the expense of the innocent victim. The result is the cahos we have on our bands today and an FCC unwilling to spend a dime to do anything to help correct the situation.

As we are not officers of the federal government, all we can do is to police ourselves. But as long as we live in an entitlement based society, there will be many who will continue to believe that even policing themselves is wrong. These are the people who also believe that they have a constitutional right to cry "fire" in a crowded theatre. Unfortunately, we seem to have far to many invading ham radio these days.

>
>Anyone with advice or similar experience?

The Pc-Pakratt 11 software was never my favorite, there were several
shareware things that did the job a whole lot better, however as with
most software, the one you know is the best.

From the start, the program creates a configuration file called
PKDEF_.DEF , that is where your setup is kept.

From memory, if you delete that file, and then type PP from the command
line you will be presented with a Configuration Menu with the following
options:-

SETUP Default Parameters
FILES Menu
Set COLOURS
. Go to communications Menu

If you set up the program as you want it , then go into the Files Menu ,
you will se a list of options :-

Save Configuration
Save Parameter Defaults
Load Configuration
Load Parameter Defaults
Set Parameter default File
Set Macro File
Specify Editor
FAX Program
External Xfer Program
Help
.Back

/save configuration/ allows you to save the comms port information, baud rate, screen colours, the name of the text editor and the name of the default file /the .DEF file/ to the file PKDEF_.CFG if the file PKDEF_.CFG cannot be found. you will be prompted for the communications port information before this information is saved to PKDEF_.CFG

The file MUST be on the same drive and in the same directory as the PK.EXE Program.

Hope this sorts out your prog.

Regards

"With no problem"???? How do you you aren't causing problems?
I cannot begin to tell you the grief you cheapskates cause(d) with
your modified radios for those us of who work(ed) in maritime comms.
Suffice it to say that transmissions with radios that aren't type-accepted
are documented whenever possible* and forwarded on to the proper
authorities. Those authorities are sometimes like sleeping giants, but
when they awake you will feel their wrath!

Don't be so damn cheap, Sharples - go buy a VHF marine band radio. West
Marine sells an all-channel rig for around $120.

Jeff KH2PZ (former Coast Guard radio officer)

* USCG coastal stations monitor many channels at once - when your trans-
missions come over two channels at the same time it's easy to determine
some penny-pinching ham is using a modified HT. Hopefully he's not as
cheap in properly outfitting the rest of his boat.

ROTFLVVL!

3639. Sound Blaster = easy WEFAX FAX SSTV RTTY

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-15 00:00:00 UTC
From: "Brian E. Cauchi" <gcauchi@keyworld.net>
Message-ID: <01bc1b89$25fdf0c0$0101a8c0@gcauchi.keyworld.net>

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc, rec.radio.amateur.space

Hello... Brian here!

If you have a RADIO and a SOUND BLASTER (or compatible card) you already have all the hardware necessary to receive WEFAX, FAX, SSTV and RTTY.

You can also transmit monochrome FAX and SSTV, with the current version of my FTV software.

*** Put the power of your 80386, 80486 or Pentium processor to real use ***

The external "decoder" units that are used by conventional users are modelled inside this software. This makes it easy to get started, inexpensive and rids you of the inevitable tangle of wires and boxes of decoders.

Absolutely no external hardware, other than a simple audio lead, is required by FTV. The current version decodes:

WEFAX (from weather satellites, e.g. 137-138 MHz)
HF-FAX (from terrestrial stations)
SSTV (from radio amateurs, e.g. 14.230 MHz)
Baudot (press, naval, weather etc)

Here is a run down of the more interesting features:

(1) It keeps the demodulated signal in memory, so that the signal can be analysed again at a different keying rate or polarity! Garbage can be resampled on the fly, which means that minutes of received signals decoded at the wrong baud rate or keying polarity are recovered, on the fly, while still receiving.

(2) The incoming signal is analysed automatically - standard modes, line rates, baud rates and keying polarity are automatically determined following analysis.

(3) Tuning oscilloscope available at all times, without loss of copy.

(4) Program works in real time.

*** What are you waiting for? Try it now! ***

Take a look at my web site for futher details, from where you can download an evaluation copy, at: http://www.geocities.com/SiliconValley/2504

Registration promotes the further development of this software and entitles the user to future upgrades paying only for delivery expenses, if any.

Finally, just in case some of you have trouble accessing my web site, here is my postal address (if you want a reply, send a self-addressed label and IRC's to cover expenses):
Brian E. Cauchi,
Gawhra, Domenico Cachia Street, Birkirkara BKR06, MALTA.

What can I say? Try it, and may you have as much fun as I am having...
73's from Brian.

3640. Tubes and Test Equipment for Sale!!

USED TUBES,UNTESTED BY US, SOLD "AS IS,WITHOUT WARRANTY",
These tubes were part of the estate of a long time radio
repairman,who was in business in the San Francisco area
from the 1930's to the 1970's.The tubes were bulk packaged
in large boxes marked "tested ok", however we have not
checked any of these tubes. We have been advised by one
of our customers that some of the tubes we shipped were
duds. These tubes have been priced accordingly.

****
* Shipping for the below tubes to anyplace in the USA: *
* 1 to 6 tubes, $3.00 // 7 or more tubes, shipping free.*
****

****
Used Tubes for $1.00 each:

OA2, 0C3, 1A7GT, 1H5GT, 1H5GT/G, 1LH4, 1R5, 1S5, 1T5GT,

Back around 1992, give or take a couple of years, Scientific American had a commentary written by a guest writer on the death of Heathkit. It was one of the best tributes I ever read concerning the demise of one of my favorites. Trying to find a copy of, or the date the article appeared - it was on the last page of one if SA issues. Wonder if anyone remembers seeing it - note a search of SA Web site had no hits on Heathkit. Ay help appreciated!

No difference in terms of loss. I'd expect that they would be
identical. Probably just different manufacturers.

Hi David,

Just before christmas I had a 55ft crank up/tilt over tower erected
here. The guy who installed it used a post hole digger to about 4ft
deep (as you mention), but after that he had an orgre bit to continue
to approx 8ft down.
The orgre bit consists of a circular cutting ring, just like a big
hole saw, but with the top open. Mine was about 12inches diameter,
with a wall height of about 6 to 8 inches.
The orgre bit must be the diameter of the hole you are digging.
The concept is that you cut into the earth creating a circular cut
around the circumference only.
With a crow-bar, or heavy steel pole, you must then compress the earth
inside the orgre after you have cut into the earth. Once the earth
inside the bit is compressed, you can lift the orgre out of the ground
and the earth will remain inside the bit.
A few hard whacks on the surface will remove the compressed earth from
the bit, and you can start over again.
The concept is a bit slow, but it works well.
The deeper you go, the more clay (and harder) the earth gets, this
makes the concept better, as the more dense earth tends to stay within
the orgre bit as you lift it out of the hole.
Let me know what you think.

Dear YL's, XYL's and OM's

which of you know something about short-backfire antennas? or better had build one for the higher bands (above 1 GHz). Please let me know about your experiences, especially about dimensioning, gain and opening angle. I'm also interested in any advice in literature (books and journals etc.) about that subject.
Please mail to the above mentioned adress. Thank you very much!

Many 73's

If the battery is a sealed unit it is probably okay, but overcharging
it may cause some problems, and gas may find a way to escape. Better
would be to put the battery outside (under the house ?) and run your
DC cable inside - just for added safety.

Good Luck.

I run a Ten-Tec Hercules II linear off of an Exide 100A Gel Cell Marine Battery, which is located in the shack, under the table that my amp sits on. I leave an Exide 1.5A (#EL 7001204) automatic trickle charger in line all of the time. It shuts off when peak voltage (14.1V) is reached and kicks back in when things dip below 13.1V. This setup works just fine for casual DXing. I have an automatic Exide 10A charger that I put in line during contest weekends. No problems at all with either configuration.

A wet marine deep cycle battery would have cost about $40 less, but the gel cell pretty much eliminates both gassing and spillage issues. In any case, go with a marine battery instead of a regular auto cell. The marine batteries are designed to handle deep discharges and frequent recharge cycles.

DX stations may now hear VK2WI on 14.170 at 0100Z and 0830Z

NEW MEMBERS.

A warm welcome is extended to the following new members approved at the Council Meeting on Friday night 14 February 1997.

VK2VZQ Mike F. RAMSAY of Bellambi
VK2ABR Michael FRAZER of Manly Vale
VK2MIA Derek NELSON of Bellevue Hill
VK2LMA Errol M. HUHTA of Barnsley
VK2ON Aaron J. LYNCH of East Maitiand
VK2HAQ Andrew CUMMING of Quakers Hill
VK2MPQ G.J. FAULKNER of Lower Boro
VK2BOJ John W. OSWALD of Taree
VK2ATW Gary K. EDWARDS of Gilgandra
VK2BET Errol J. TRIMINGHAM of Hornsby Heights
VK2BJC Brendan J. CONNOLLY of Gosford
VK2KS William F. TAM-GRANGE of Narellan
VK2ZDK Roland E SMALLACOMBE of Rozelle
VK2IBL Bob LUZAIC of Mt Druitt
VK4AIL Raymond J MANSFIELD of Scottville
VK4ABJ Jeff AUST of North Rockhampton

We hope you will have a long and happy association with the WIA.

--Eric Fossey VK2EFY, Divisional Secretary.

VK2WI AND THE CENTRAL COAST FIELD DAY

VK2WI listeners please note: due to the Central Coast Field Day, next weekend, there will be no morning broadcast next Sunday. Instead, there will be a broadcast on Saturday evening (the 22nd), starting at 7:30pm. The usual Sunday evening broadcast will go to air at its normal time of 7:30pm.

ATTENTION AFFILIATED CLUBS

The Divisional Office has been receiving phone calls from around the state, requesting starting dates of courses and the name of the nearest organization running them. Secretaries of Affiliated clubs, would you please let me know either by mall or Fax urgently at the VK2 divisional office if and when your club is running a course also include a contact phone number that can be given out to these prospective amateurs.

--NSW Affiliated Clubs Officer, Ken Westerman VK2AGW Dunedoo.

TRASH & TREASURE SALE

Because the last Sunday in March is Easter Day, the March Trash &
Treasure Sale will be held on the Sunday After Easter - that's the 6th of
April.

--Submitted by Eric Fossey VK2EFY - Divisional Secretary.

DIVISIONAL ELECTIONS

The Elections for the 1997-1998 Council of the Wireless Institute of
Australia New South Wales Division will be held in association with the
Annual General Meeting on the 19th April 1997.

Nominations for the council are now open and they will close at 12 noon on
Saturday 8th March 1997. The Divisional Office will be open that day as
well as it's normal opening hours, which will be given elsewhere in the
broadcast.

Nomination forms are NOW available from the Divisional Office.
A special note for members.

Only ordinary members and honorary life members are eligible to vote in
the forth coming ballot. Associate members are not eligible to vote in the
ballot. An ordinary member is one who holds a "Certificate of Proficiency"
of any level. An associate member, is one who does not hold such a
"Certificate of Proficiency" - commonly called a shortwave listener.

So any members who have doubts about their membership status are
invited to contact the Divisional Office to confirm their membership status.

The Office's telephone number is (02) 9689-2417
The office's fax number is (02) 9633-1525
The Office's free call number is 1800 817-644
The Divisional Office's address is
109 Wigram Street Parramatta
P.O. Box 1066 Parramatta N.S.W. 2124

--Peter O'Connell VK2EMU, Divisional Returning Officer

WICEN NEWS

The Central Coast Amateur Radio Club Field Day will be held next Sunday,
at Wyong Racecourse. Naturally, WICEN will have a display, in order to
demonstrate the community value of Amateur radio, and both ideas and
bodies are sought. If you can volunteer either or both, then please contact
Frank VK2XVJ.

Our plea for notification of events has borne fruit; the Hunter region has
advised of several events. Tomorrow is the regular bi-monthly meeting of
the Hunter region, at the Emergency Operations Centre, presided over by
Pauline VK2GTB. The March meeting, on the 17th, will feature a talk on
Telstra, which promises to be interesting. On 13th April is the Forster
Triathlon. This is an all-day event, early morning to late evening, and about

25 operators are required for this event; food, drink, fuel and T-shirt are provided. Operators will need to bring equipment for 2m and 70cm voice, and will also need to contact Richard VK2CHC for further details.

Next month sees the Central Coast meeting, on the 14th March. This is followed by the Wyangala Triathlon, in the Orange area, to be held on Sunday 16th March; enquiries are directed towards Robert VK2ZRJ. We expect to have further details in later broadcasts. Following this is the VRA Mid Year Conference, at Wombeyan Caves, on the weekend of 22nd-23rd March.

Events further away include the Watagan Mountains Car Rally, over the weekend of 19-20th April, for which Andy VK2XRX is the contact; around 20 people are required for this exercise. Later on is the Hawkesbury Emergency Expo, run by Alan VK2YYJ, over 16th-18th May; the Oberon Car Rally, also run by Alan VK2YYJ, on the 11th October; the Hawkesbury Classic Paddle is organised by Kevin VK2CKD over 18th-19th October and the annual Bungonia Cave Rescue will be on the weekend following, over 25th-26th October.

WICEN is always looking for members to provide the community with communications assistance. Write to WICEN (NSW) Inc, PO Box 123, St Leonards 2065 for further information, or come up on one of the WICEN nets: Northern Rivers each Tuesday at 8pm around 3610 kHz on odd Tuesdays and the Lismore repeater 6800 on even Tuesdays, Hunter each Wednesday at 7.30pm on the Newcastle repeater 6900, and Central Coast each Thursday at 8.30pm on the Wyong repeater 7125. If there are any other regular nets then we'd like to hear about them.

WICEN (NSW) has a Web page, and the Uniform Resource Locator is: "http://www.nsw.wicen.org.au/". It is generously provided by the Macquarie University School of Mathematics Physics Computing and Electronics, and contains pointers to many emergency-related pages likely to be of interest.

-- Dave Horsfall VK2KFU, WICEN (NSW) Inc. Publicity Officer

MAGAZINE ROUNDUP

Here again is a summary of the local magazines, which in the author's opinion could be of interest to Amateurs. This week we discuss the February issues of the various magazines.

"Electronics Australia" discusses to death the risks from digital cellphones; flip-flop chips are introduced; the PC-driven arbitrary function generator is continued, as is the series on Direct Digital Synthesis modules; and the secrets of building a rat's nest upon the bench are revealed.

"Silicon Chip" discusses various faults inherent in PCs; the computer-controled power supply is continued; history is made when an Austel-approved telephone ringer kit is published; those new to electronics can get their feet wet by building a multimeter; the control panel for multiple smoke alarms is continued; digital oscilloscope displays are interpreted; the problems of RFI on radio-controlled models are discussed; and battery eliminators are remembered.

"Amateur Radio" discusses meteor scatter operation; a combined CW and speech filter circuit based upon one chip is built; operating amateur radio from yachts is discussed; the rules for the annual John Moyle Contest appear; the problems of operating "portable" are presented; and the FM-828E is converted to 6m, along with a "true FM" modification.

"Radio and Communications" presents some questions and answers on scanners, including hints on how to smuggle a new purchase past the Chancellor of the Exchequer; conventional current versus electron current is discussed; an audio processor with AGC is contructed; the problems of pre-amps are presented; those into home-brewing can read up on how to choose a heat-sink; crystal mixers are mentioned; and finally, we point out that an advert for the sale of VK2XBR's equipment is a fake.

Finally, your scribe would only be too pleased to review the technical content (if any) of the journal of the Amateur Radio Advancement Association of Australia (ARAAA); they have been remarkably coy in providing this reviewer with a sample copy, so can anyone assist? Be listening next month for another summary of the local magazines.

-- Dave VK2KFU

DX NEWS

UGANDA - Gus 5X1D, can usually be found on 6 and 2 meters.

GHANA - Steve 9G5BQ will be active until early March. Lately, he has been found on 3514 kHz starting at 2200z and was heard as late as 2345z.

MINAMI TORISHIMA - JG8NQJ/JD1 will be here until April 23. His activity will be limited due to his work schedule, however. Look for him on 40 through 10 meters from 0100 to 0200z, 0600 to 0700z, 0930 to 1100z and 1300z.

ST. KITTS - Alex V47KP will be active until early March.

MICRONESIA - Sam V63KU, is very active on 20 meters SSB and is usually QRV for a few hours between 14175 and 14200 kHz starting around 2100z.

BURKINA FASO - Dan XT2DP has been active on 80 meters around 3795 kHz at 2000z. XT2AR is also QRV from Ouagadougou, and will be here until February 26.

CAMBODIA - Robert KE2FB works at the US Embassy and is active as XU2FB on 80 through 10 meters. He uses CW, SSB and RTTY. He can also be found on 10 meter FM.

--extracted from the ARRL DX bulletin No. 9, dated 13 February, 1997

Still with DX News, we received the following via email this week:

The Ontario DX Association will be sponsoring the 1st Annual Ontario QSO Party to run from 18:00 UTC on April 26, 1997 to 18:00 UTC on April 27, 1997.

Ontario amateurs work the world and stations outside Ontario work Ontario stations earning multipliers by the political subdivisions of Ontario (counties, districts and regional municipalities).

The contest takes place on all HF bands (except WARC) and on VHF/UHF.

Complete rules are available on the Radio Amateurs of Canada (RAC) website at http://www.rac.ca/odxa.htm or you can request a copy of the rules by sending a short e-mail message to 103111.2775@compuserve.com

CLUB NEWS

The first meeting of the Radio Veterans Group for 1997 will be held, Deo Volente, this Thursday, 20th February, from 11am to 2pm, at Amateur Radio House, 109 Wigram Street, Parramatta.

-- Franklyn Pain VK2DYP

AUSTRALIAN AMATEUR PACKET RADIO ASSOCIATION

AN INVITATION TO VISIT AAPRA AT WYONG NEXT SUNDAY. NON PACKET RADIO OPERATORS WILL BE ABLE TO SEE HOW SIMPLE IT ALL IS.

EXPERIENCED PACKETEERS CAN SEE AND DISCUSS SOME NEW HIGH-TECH HARDWARE DEVELOPMENTS.

SOFTWARE COLLECTORS WILL BE ABLE TO SEE ALL THE TITLES IN THE EXPANDED SOFTWARE DISK LIBRARY.

--FROM GEOFF VK2BQ PUBLICITY MAN

WAVERLEY AMATEUR RADIO SOCIETY

Our next meeting is on Wednesday 19th February, being the 3rd Wednesday of the month. Laurie McIlree, VK2GPL, is coming along to explain how repeaters are set up and operated and bring us up to date on the latest developments of Fibre Optics.

The first Saturday afternoon of each month is project day, so drop in on March 1st from 1:30 onwards and get involved in some practical work or just come along and socialise. Project day has proved most useful to a number of members by helping them fix rigs with faults or just to receive assistance in the operation of modern rigs.

The Society's clubhouse is located in Vickery Avenue, Rose Bay, off New South Head Road, next door to the Rose Bay RSL Club, where a number of us gather for a meal before the meeting.

--Simon Buxton, VK2EII, Club President

CASTLE HILL MILITARY RADIO COLLECTION

The Castle Hill Military Radio Collection display at the Wyong Field Day will include the following pieces of equipment:

1. GRC- 106 U.S. Army H.F. Transceiver

2. Radio Corporation 208 2.5-3.5 mHz portable commando set.

3. British Army #18 Transceiver, on which the Australian 108 set was based

4. 4.An AWA Australphone transceiver as used by the Australian Army.

5. A U.S. Army Air Force BC 639 VHF ground receiver, being a tuneable 100-150 mhz set used with the airborne SCR522.

6. A BC 683 U.S. Army Tank receiver, designed for FM/CW operation from 27-40 mhz.

Leaflets giving information and circuits will be available as usual. Please contact Ian before the day if you require circuits of other equipment and he will bring these to the Field Day.

If you have equipment, spares or manuals to donate to the collection please give Ian a ring on (02) 9680 2112.

Ian will have the trusty empty trailer with him on the day to transport equipment back to Castle Hill.

--Ian O'Toole, Curator, Castle Hill Military Radio Collection

ORANGE AND DISTRICT AMATEUR RADIO CLUB

The Orange Club wants to remind everyone about their "Wyangala 1997" two metre communications exercise of Sunday 16th March and to thank all those who have already offered to take part as operators. Last year's crew are being invited again for 1997 by mail this week and several club secretaries have also been sent invitations for their members. The exercise is four weeks off and at this stage more people are definitely needed (this is a BIG ONE remember, with 32 or more operators!) so please get on the blower and ring Peter VK2ETK on 063 61 3439, or Adam VK2XRA on 063 61 2264 before you forget. And, if you have HF you could hang around after this broadcast and catch VK2ETK on the 80m callbacks.

Those phone numbers, again: 063 61 3439 and 063 61 2264, and You can add an lntemet e-mall address too. aroberts@ix.net.au and also a fax number: 063 62 2782

From Peter VK2ETK of the Orange and District Amateur Radio Club

HORNSBY & DISTRICTS ARC.

The next meeting takes place, on the 25th. Febuary 1997, at 8:00 pm. Meeting place is, Mount Colah Community Centre, Pierre Close, Mount Colah. (Near the Eastern Entrance to the Railway Station). This is the formal monthly meeting, taking care of all business that has arisen, since our last formal meeting. After the business section, of the meeting is over, there will be a lecture, on the Internet and Amateur Radio by Dave VK2KFU. All are welcome.

Training classes commenced last Thursday, so if you intend to enroll, do so now, as after the first few lessons, it becomes a bit harder to grasp, it's like a book to fully understand, you read from page 1. The training classes will

be held each Thursday evening at 7:15 pm., in a hall at the corner of Paimerston Rd. & Burdett St. opposite the Hornsby Hospital. For more information phone, Tony VK2BTL on 9487 3383.

The Club conducts, a net every Monday night, at 8:00pm. on VK2RNS. The frequency is 147.250 with a positive offset. Feel free to join in. All are wellcome. Listeners set your scanner to 147.250.

Should you wish to know more about the Club. or its activies, please write to:- H.A.D.A.R.C. at Post Box 362, Hornsby, 2077. or contact the Publicity Officer, John on 9807 2490.

--Submitted by John W Turner VK2WRT - Publicity Officer.

MANLY-WARRINGAH RADIO SOCIETY

This coming Wednesday is lecture night at the Manly-Warringah Radio Society, and all members and visitors are welcome to attend. this week, Richard VK2SKY will talk about the WIA Divisional broadcast, and will also give a demonstration of "surfing" the Internet and the World Wide Web.

The Manly-Warringah Radio Society meets every Wednesday night at the Warringah Volunteer Services Centre, Kamber Road, Terrey Hills, with a business meeting on the second Wednesday and a lecture on the third Wednesday of the month. Visitors are always welcome. Just call in on the club two metre repeater on 146.875 MHz if you need directions. Shortwave listeners can phone the club any Wednesday evening on (02) 9450-1746.

Hope to see you there!

--Richard VK2SKY

CHIFLEY AMATURE RADIO CLUB

The club meets every Saturday at 1:30 PM.

The address is, The Good Shepherd Church at Hyatts Road Plumpton. Members, guests, visitors are all welcome.

You can call on the club repeater on 147.075 if you cannot find us. The club holds a 2 meter net on the club repeater at 8:00 every Friday night all checkins are welcome.

The Club conducts classes, to obtain an amateur licence, on Wednesday night at 7:00. For info ring (02) 9837 2226 or (02) 9834 1186. Coming events, A club meeting on Saturday 22.Feb.97

--The Publicity officer Michael VK2EK

COMING EVENTS

Divisional examinations at Parramatta.....Today
Australasian Communications & Computing Ass'n meeting.....Monday
Hunter WICEN meeting.....Monday
Fishers Ghost ARC Annual General Meeting.....Tuesday

Waverly ARS meeting.....Wednesday
Manly-Warringah Radio Society lecture night.....Wednesday
Radio Veterans meeting at Amateur Radio House, Parramatta.....Thursday
CW Operators QRP 80m Scrambles.....Thursday
Chifley ARC meeting.....Saturday
VK2WI Saturday evening broadcast.....Saturday
VRA mid-year conference at Wombeyan Caves.....Saturday-Sunday

Central Coast ARC Field Day at Wyong (NB: no VK2WI morning
broadcast).....next Sunday

CW Operators QRP 40m Scrambles.....24th
Hornsby & Distric ARC meeting.....25th

MARCH
Dural Committee meeting.....TBA
John Moyle Memorial Field Day.....TBA
Waverley ARS project day.....1st
Far South Coast ARC Annual General Meeting.....2nd
Nominations for Divisional Council close.....8th
Central Coast WICEN meeting.....14th

If you would like to submit a news item for inclusion in the weekly
broadcast, please send it to us by one of the following means:

by post to the Divisional Office, PO Box 1066, Parramatta NSW 2124;
by fax to (02) 9633-1525;
by packet radio to BCAST@VK2WI.NSW.AUS.OC, or
by Internet e-mail to wiansw@sydney.dialix.oz.au

Please note that the deadline for news items is 2pm on the Friday
preceding the broadcast; if submitting news items by packet or internet,
please allow for forwarding delays in the network.

If submitting printed copy, please:
submit your news item on A4-size paper;
double space your text;
write on one side of the paper only, and
use a plain font such as "Arial" or "Helvetica", 12-point or larger. This is
especially important if sending your news item by fax.

Please avoid using abbreviations and shorthand, check your spelling,
grammar, and punctuation, and use the exact words you wish the
announcer to say on-air. Remember, the more care you take in preparing
your news item, the better the announcer will read it.

>You shouldn't attempt to speak in an authoritative manner regarding areas
>not fully cognizant of.

Your point is? Certainly you aren't attempting to claim that a military
which we rolled over in 120 hours is a major modern miliary power are
you? Iraq tried to use WWI tactics, and equipment functionally on the
WWII level, to fight a modern war. A numerically inferior, but technically
much further advanced, Coalition force cleaned their clocks in short order.

There is little wonder you couldn't copy the Morse intercept, since
the Iraqis didn't convienently use English as the language they chose
to encode in Morse. And unlike a certain science *fiction* movie,
Morse didn't allow the Iraqis to prevail over a more technically
advanced force.

And BTW, that would have been a JSTARS aircraft, not an AWACs, if
it were monitoring ground force movements. AWACS is configured to
control an air battle (something the Iraqis couldn't provide us).
JSTARS, an innovation first used in the Gulf War, is configured to
monitor ground movements of enemy forces. It carries radio intercept
equipment. And as a further BTW, we no longer use raw radar images.
What you saw was a computer generated image processed in realtime
from the raw radar data generated by an electronically scanned

phased array radar system designed to pick out targets on the ground.

Note that I don't want to give the impression that the Iraqi military was a creampuff. They had fought a grinding 8 year trench war with Iran, and were tough hardened combat veterans. But they were simply outclassed in technology, and by the tactics that technology permitted. For the past 50 years, we have been developing a military force to deal with a large Soviet style armored force, and it clearly worked as intended.

There is a clear lesson to be learned here. The Iraqis, as Soviet clients, were geared up to fight a slightly modernized version of WWII. Our forces were geared up to fight a modern technological war. The result is obvious. Computers and modern communications are an integral part of the CCC which allowed the Coalition victory. You can't fight a modern technological war with slide rules and Morse Code.

>services.

I might add that unless the radio's that are modified to operate in
other bands cause a problem, the manufacturers have no incentive to
prevent the mods. It took an act of congress to get the scanner/ham
radio's to not scan cell band easily. Yes I know that there are lots
of them that can do that still.

The FCC doesn't look over your shoulder to see what kind of radio you
operate. People are always looking for the cheapest way to get a job
done. If that means getting a ham radio instead of an expensive
commerical, they will do it. The mods are all over the net.

I'm not saying its ok to do this, but that is how the market these days
is geared. The mods have proven to be a very popular feature and will
continue to be included in the radio's.

>slightly different, I think.

There are provably secure methods of encryption. The one time pad is
the classic example. It is unbreakable even in theory as long as the
cracker can't gain physical possession of the key. This scares the
government silly. If such encryption tools became widely available
to the public, and some of them are really quite simple, it would be
impossible for the government, or anyone else, to snoop through
citizens' computer records or eavesdrop on their telephone calls.

You can easily implement a one time pad on your PC equipped with a
CDROM drive. If you have a speakerphone on your PC (like those which
come on COMPAQ's multimedia machines), you can make provably secure
telephone calls to someone with a similar setup today. And you can
encrypt your private files so that no one, not even the government
with their most powerful computers, can crack them without the key.

The technology is available for provably secure communications and provably secure computer records today. The government doesn't want you to know that, and it doesn't want you to use it if you find out about it. But the genie is out of the bottle. Anyone can do it today if they wish.

It depends on the channel quality, of course. For most HF channels,
4 levels, or at most 8, reach the point of diminishing returns for
FEC armored data transmissions.

>> Then move up to contextual decoding. The reason for two
>>stages is that you really cut down on the amount of data by time you get to
>>the context stage of the game.
>
>It helps a lot if you can concentrate on the most "suspect" decisions.

That's true for data communications which is using FEC. An erasure
is much more valuable to the algorithm than a suspect bit. But for
Morse copy, there is no FEC, and erasures are much less valuable.
You may be more effective just using contextual clues to see if the
element "makes sense" rather than depending on a soft decision
decoder's flagging of suspect carrier sense. Remember, with non-
coherent Morse, you aren't even sure you are sampling during an
element interval at this point, so the soft decision isn't really
telling you anything useful.

You'll notice that our efforts to connect computers via radio are
recognised as
a worthwhile achievement by hams...

Efforts by hams to connect computers by telephone are not so impressive.

"Amateur Telephone" operators whose activities damage the existing global
amateur radio digital network should take note, and desist..

Hams are not impressed when someone uses the telephone and pretends it's
amateur radio, and neither is anyone else.

Yes! Through the magic of the Internet and FTP, I am now proud to offer you...the distinguished readers and participants of rec.radio.amateur.misc...the opportunity to download five newly created and digitally mastered sound files! Hear for yourself why I affectionately refer to 3894-dot-5 as "The Zoo of Amateur Radio." Just listen to what you get:

1) BIG-AL-SAT-NITE-LIVE...Hear Big Al, "cranked up" and ready for a night's entertainment as he encourages and provokes his arch-rival "Pork Butt!"

2) PORK-BUTT...Listen to Pork Butt return the fire! Featuring the famous "white trash in America" monologue.

3) PIG-PEN-PETE..."HO HO, HO HO, HO" Here's our friend Pete, getting in his two cents' worth...and being severely admonished by his fellow amateurs for his efforts.

4) RALPH-THE-THIEF...Check out Big Al's response when he discovers Ralph's attempts to wreak havoc on his reception by transmitting the sounds of a BABY CRYING in Al's neighborhood!

5) THE-JAMMING-STOPS...Pork Butt on the offensive, commenting on Al's latest attacks.

It's amateur radio at it's best! Hear for yourself what I've been talking about on this forum. All original hits by the original stars of 3894.5 that made 'em famous! Digitally mastered for optimum sound quality and available NOW via your modem at the following FTP site: members.aol.com:/mnmaniac/3894.5

Don't delay! Download today! And thanks for yer support! :-)

Potter & Brumfield circuit breakers for small electronic equipment use, #W58XB1A4A1 (1 Amp), originally purchased from Newark Electronics (#56F870) and cost $10.07 each in single quantity and $7.64 each in 99 quantity.

They're the type almost everyone's seen at one time or other; brown with 1/4" quick connects in back & a white reset button in front with the ◆1◆ on it. There are 480 of these new in the original shipping carton!
Perfect for building into some new equipment! Want to sell the whole box together. Make me an offer for all!

>
> Gary
> --

How absolutely silly. No out-of-context "wav" files can be used to judge the extent of the "problem" on HF or elsewhere. Only through long-term listening can one understand what is happening, how often, by whom, and the context. Only Drew's little minions on the newsgroup could have deluded themselves into thinking that he is performing some sort of "service" (and there are only TWO of them, both CBers!) Drew's nightly reports, in which he puts his own "spin" on things, are useless, unwanted, and have been observed to be so by countless hams on this group.

If you don't have your own receiver so that you can judge for yourself, you'll never know what is ACTUALLY going on, and don't count on Drew to give it to you. He has an agenda here, and if you think it's somehow for the "good of mankind", you are mistaken.

His posting continues mainly because a few on 3894.5 have given him .wav files to post, and now he can get the attention he is craving.

YOU CAN MAKE $50,000 IN LESS THAN 90 DAYS IN THE COMFORT OF YOUR OWN HOME!

**** DO NOT BE QUICK TO DISMISS THIS !!! IT WILL MAKE YOU A LOT OF MONEY ****

...Read the enclosed program... then read it again!

Dear Friend,
You are now reading the most profitable and unique program you may ever see. It has demonstrated and proven ability to generate large sums of money. This program is showing fantastic appeal with a huge and ever growing population which needs additional income. IT WILL WORK FOR YOU, (don't let this slip through your fingers like I almost did) if you CAREFULLY FOLLOW the instructions and apply these next four points:

(1) INSIGHT: It is necessary to see the GREAT possibilities that this marketing program contains. READ IT SEVERAL TIMES, then later read it again! Calculate the numbers for yourself; you will see the amazing results that can be obtained.

(2) INVESTMENT: Not in me, or anyone else, but in yourself. Every endeavor which produces a profit requires some degree of investment, be it time, money, resources, etc. For the potential gain that can come to you, this investment is quite insignificant.

(3) APPLICATION: There is no such thing as a "FREE LUNCH". Even this opportunity requires some effort and time. Every successful venture does.

(4) PATIENCE: After you have accomplished the steps described, the program requires a little time before showing a good response. As it enters the 1st, 2nd, 3rd, and finally the 4th level of response, there is a time element that to some could be a bit aggravating without giving proper thought to *how* the program works, AND IT DOES WORK! You must allow 20 to 90 days... so be patient! "ALL THINGS COME TO THOSE WHO WAIT!"

This is a LEGITIMATE, LEGAL, money-making opportunity. It does not require you to come in contact with people, do any hard work, and best of all, you never have to leave the house, except to get the mail. If you believe that someday you will get that lucky break that you have been waiting for, THIS IS IT! Simply follow the easy instructions, and your dream will come true! This multi-level mail order marketing program works perfectly... 100% EVERY TIME.

Thousands of people have used this program to raise capital to start their own business, pay off debts, buy homes, cars, etc., even retire! This is your chance, so don't pass it up... I cannot stress this enough! FOLLOW THE INSTRUCTIONS EXACTLY, and in 20 to 90 days you could receive upwards of $50,000. Let's face it, the profits are worth it! THEY'RE

TREMENDOUS!!! So go for it. Remember the 4 points and we'll see you at the top!

I N S T R U C T I O N S
==========

Follow these easy steps to achieve maximum results:

In the MULTI-LEVEL MAIL ORDER MARKETING BUSINESS, we have a method of raising capital that works 100% every time! I am sure that you could use $50,000 to $125,000 in the next 20 to 90 days. Before you say "NO WAY", PLEASE STUDY THS PROGRAM CAREFULLY.

THIS IS *NOT* A CHAIN LETTER, but a legal, money-making opportunity. Basically, this is what we do: As with all multi-level businesses, we build our business by recruiting new partners and selling our products. We do this through regular mail or through the information superhighway - the Internet. You are not involved in personal selling. You do it privately in your own home, store or office! Each $5.00 order you will receive will have a self-addressed stamped envelope in it! To fill each order, you simply put the product (a financial report) in the envelope and mail it back. "That's it... the $5.00 is yours." This is the GREATEST multi-level mail order marketing anywhere!

(1) ORDER ALL 4 REPORTS LISTED AND NUMBERED BELOW IN THIS LETTER. Do this by ordering the report from each of the four names listed. For each report send US$5.00 cash and a SELF-ADDRESSED STAMPED ENVELOPE (business size #10) to the person listed and REQUEST THAT SPECIFIC REPORT. You will need all 4 reports because you will be reprinting and reselling them. PLEASE do not alter the names or their sequence other than instructed in this letter. IMPORTANT: Always provide same day service on all orders you receive!

(2) In this letter, replace the name and address under REPORT #1 with your own, moving the one that was there down to REPORT #2. Move the name and address under REPORT #2 to REPORT #3. Move the name and address listed under REPORT #3 to REPORT #4. The name and address that was under REPORT #4 is dropped off the list and is no doubt on the way to the bank. When doing this please make certain you copy everyone's name and address accurately. *Don't move the Report/Product positions*.

(3) Re-distribute this whole information packet (with, of course yourself at REPORT #1 position and everyone else bumped down one notch). You can do this in one of two ways:
(a) Internet : Just like I've done here, it's quick and it's virtually free... send this letter out via e-mail to every e-mail address you know or can get your hands on. There are many companies out there who sell huge e-mail address lists at very low prices. This is a great place to start! In this way you can send this letter out to virtually hundreds of thousands rather than just a few thousand as with snail mail. This will greatly multiply your profits. You can also post this letter on the internet newsgroups, the more the better for you... millions of people world-wide scan these

newsgroups... take advantage of that fact.
(b) Old Fashioned Snail Mail : Take this information packet to your "quick print" shop and have as many copies of each made as you can initially afford to print. You can always print more later. (The more copies, the bigger the discount). Send a copy of this entire package (it is all important) to everyone whose name and address you can get your hands on.
Start with friends and relatives since you can speak to them and encourage them to take advantage of this marvelous money making plan. Then as your time and finances allow, mail to anyone and everyone. You can get names and addresses from classified ads, phone books and other directories. You can also mail to small businesses whose addresses are available from their ads in the Yellow Pages and other publications. BEST OF ALL, purchase a "HOT NAME" mailing list from any of the list of brokers whose business it is to provide all sorts of mailing lists. You'll find that a good name list will make you more money than you could ever imagine... it's a great investment!

(4) Orders will soon start arriving in your mailbox for each of the 4 reports. At first, just for REPORT #1, then later for #2, #3, and #4... each of these orders will contain a US$5 bill and a self-addressed stamped envelope for you to use to mail back the requested report. It's easy!

HERE'S HOW THIS AMAZING PLAN WILL MAKE YOU $ MONEY $:

Let's say you decide to start small just to see how it goes and we'll assume you and all those involved only sent out 200 packets each (either via e-mail or via regular mail). Let's also assume that each mailing only receives a 5% response (keep in mind that many people will send out thousands of packets instead of only 200, but for the sake of example here we'll stick with 200). With a 5% return that's 10 people who participate by sending 200 each or 2,000 total. The 5% response to that brings 100 orders. Those 100 mail out 200 each or 20,000 total. The 5% return on 20,000 is 1,000. The 1,000 send out 200,000 total and that 5% response will generate 10,000 five dollar bills for you... CASH! Your total income in this example situation:

1st Level - 10 people respond out of 200 with $5 $50
2nd Level - 10 people respond to those 10 ($5 x 100) $500
3rd Level - 10 respond to the 100 ($5 x 1000) $5000
4th Level - 10 respond to those 1000 (10000 $5 bills) $50000
======
This totals to $55000

Remember friends, this is assuming that 95 out of every 100 people you mail to, do absolutely nothing with this opportunity and trash it. Dare to think for a moment what would happen if everyone sent out 1,000 packets instead of 200 (very easy to accomplish that via e-mail). Believe me, many people will do just that... and more. It is to their benefit to do so! Not a bad return for such a paltry investment of time and money.

T I P S F O R S U C C E S S
==========

Treat this as your business. Send for the 4 reports IMMEDIATELY so you will have them when the orders start coming in because: When you receive a $5 order, you *must* send out the requested report to comply with the US Postal & Lottery Laws, Title 18, Sections 1302 and 1341 or Title 39 Section 3005 in the US Code, also Code of Federal Regs. vol. 16, Sections 255 & 436 - which state that "a product or service must be exchanged for money received".

WHILE YOU WAIT FOR YOUR REPORTS TO ARRIVE:

(1) Name your new company (or use your own name if you wish).
(2) Re-arrange the names and addresses, including yours, and affix them under the correct report according to the directions, bumping off the 4th name (If you will be advertising by snail mail, you might want to re-type that whole page where the names and addresses appear, and of course include yours at REPORT #1).
(3) Obtain as many e-mail addresses or regular snail mail addresses as you can. If sending via snail mail, REPORT #3 (.. when you receive it in the mail) will tell you where you can get great snail mailing lists.
(4) If sending by snail mail, make enough copies of this letter to fill your mailing quantity.
(5) Copy the 4 reports when you do get them so you are able to send them out right away when you receive an order.

The check point that guarantees your success is simply this: You MUST receive 15 to 20 orders for REPORT #1! THIS IS A MUST! If you don't within 2 weeks, send out more packets until you do. Then, a couple of weeks later you should receive at least 100 orders for REPORT #2. If you don't, send out more packets until you do. Once you have received 100 or more orders for REPORT #2, YOU CAN RELAX, because YOU ARE ON YOUR WAY TO $50,000!. Also, remember, every time your name is moved down on the list you are in front of a different report, so you can keep track of your progress by what report people are ordering from you. "IT'S THAT EASY".

Now, here is the list of the 4 reports and whom to order them from:

(NOTE: Always send a Self-Addressed, Stamped Envelope with US$5 cash - concealed, of course - in your order for each report. Order each report by name and number).

* REPORT #1: "HOW TO MAKE $250,000 THROUGH MULTI-LEVEL SALES"

. This report will give you the much needed information to help you in this program. It will show you how you can make a quarter of a million dollars in just 3 months. $5 cash.

Order This report from : K. Lundgren Enterprises
P.O. Box 31030, Gladstone RPO
Halifax, Nova Scotia, Canada, B3K 5T9

* REPORT #2: "MAJOR CORPORATIONS AND MULTI-LEVEL SALES"

. Learn the money making secrets of some of the well-known corporate giants. $5 cash.

Order this report from : MYGIA Enterprise
P.O. Box 424
Mifflinville, PA, USA 18631-0424

* REPORT #3: "SOURCES FOR THE BEST MAILING LIST"

.You have learned the importance of good mailing lists. Here is where you can send for them. $5 cash.

Order this report from : Home Business Unlimited
1954 Norfolk Dr.
Lodi, CA, USA 95242

* REPORT #4: "EVALUATING MULTI-LEVEL SALES PROGRAMS"

. Find out which plans work, which ones don't... and why! $5 cash.

Order this report from: Bill & Carolyn Ltd.
4707 Lippi Pkwy.
Sacramento, CA, USA 95823

.. I wish you good fortune and prosperity!

Cheers!
K. Lundgren

A NOTE FROM THE ORIGINATOR OF THIS PLAN
==========

By the time you have read the enclosed information and looked over the plan and the reports you should have concluded that such a plan, and one that is legal, could not have been created by an amateur.

Let me tell you a little about myself. I began as an independent small businessman in 1969. Using good business practices I had a profitable business for 10 years. In 1979 my business began falling off. I was doing the same things that were previously successful for me but now they just weren't working.

Finally it hit me. It wasn't me. It's just that our economy had gone crazy. Inflation and recession had replaced the stable economic growth that had been with us since 1945. I don't have to tell you what happened to the employment rate because many of you know from first hand experience. There were more small business failures and bankruptcies than ever before... Traditional methods of making money will never allow you to move up or "get rich". Inflation will see to that.

You have just received the information that can give you financial freedom for the rest of your life. With practically no risk and just a little bit of

effort, you can have more money in the next few months than you have ever imagined.

I should also point out that I will not see a penny of your money or anyone else's who participates in my plan. *This one's for you*.

I've made over FOUR MILLION DOLLARS and retired from the plan after having sent out over 16,000 letter packets. I have moved to the rich side of the tracks. Will you be able to say the same in six weeks ? If you send out only one-tenth as many packets as I did, you can be a rich person.

Please follow the plan exactly as instructed. Do not change it in any way. It works exceedingly well as it is now. Remember to send a copy of all this introductory literature to everyone that you can think of. Don't feel hesitant about sending out only a few dozen packets in the beginning. One of the people that you send this packet to may send out 5,000 and your name will be on every single one of them. Remember though: the more you send out, the more potential customers you will reach. So my friend, I've given you the ideas, information, materials and opportunity to become financially independent. IT'S NOW UP TO YOU.

I am enjoying an early secure retirement on the fortune that I made by sending out packets just like this one. You too will be making easy money in three or four weeks... if you follow the simple steps outlined in this mailing. To be financially independent is to be free; free to make money decisions as you never have before, go into business, get into investments, retire, or take a vacation. No longer will the lack of money hold you back...

Will you ignore this amazing opportunity... or will you take advantage of it and change the direction of your life ? If you don't think this is a truly spectacular opportunity, then please take the time to re-read this material. You have indeed missed something. If you have any questions, please feel free to write the sender of this information. You'll get a prompt and informative reply.

My method is simple. I sell thousands of people a product for $5.00 that costs me pennies to produce and mail. Everyone involved in the program makes money for everyone else in the program. IF ANYONE MAKES MONEY, EVERYONE MAKES MONEY. I should also point out that this program is completely legal. At times, you've probably received chain letters asking you to send money but getting nothing in return - no product whatsoever. Not only are chain letters illegal, but the risk of someone breaking the chain makes them quite unattractive.

This plan has the effect and appeal of a chain letter, but is is legal since you are offering a legitimate product to your people. After they purchase the product from you, they produce more and resell the product. It's simple free enterprise at work, THE AMERICAN WAY.

As you have learned from the enclosed material, the "PRODUCT" in this plan is a series of four financial and business reports. The information contained in these reports will not only help you in making your

participation in this plan more rewarding, but will be useful to you in other business decisions you make in the years ahead. You are also buying the rights to reprint all of the reports which will be ordered from you by those to whom you choose to mail this packet.

The concise one and two page reports you'll be buying can easily be reproduced at a local copy center at a cost of approximately 4 cents per page in small quantities of 200. The price goes down considerably for larger quatities of 1,000 or more. Of course you may want to print just a small quantity until the money comes rolling in. You can always call your printer with another order.

. Good luck with this plan and GOD BLESS YOU,

Edward L. Green

3687. Ham numbers by country

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-16 00:00:00 UTC
From: Jim <jim.parnell@nzart.org.nz>
Message-ID: <33080153.7A54@nzart.org.nz>
Source record: 204498

I have spent several wasted (but interesting) hours trying to find a web site that has a list of the numbers of amateurs in those countries which have a ham population. Web searchers, and site searches have located the list I need.

Surely there is a list somewhere!!!

Can anyone (without spending time searching themselves) provide the URL of a site with the information I need?

Many thanks in anticipation.

Jim, ZL2APE.

True.

>But for
>Morse copy, there is no FEC, and erasures are much less valuable.
>You may be more effective just using contextual clues to see if the
>element "makes sense" rather than depending on a soft decision
>decoder's flagging of suspect carrier sense.

Morse code is an early form of text compression using the shortest codes for the most common characters. There was an article in Wireless World "Did Morse get it right" (or a similar title) showing the effectiveness for encoding plain text in certain languages and not so effective, when encoding plain text in other languages.

Anyway, the problem with compression and in particular variable length coding is that it requires a reliable transport medium, either with a high SNR or some form of FEC. OOK Morse is a vulnerable form of variable length coding, since it is very easy to loose character synch due to a single bit failure. If you have a short sequence of dots and dashes with some suspect dots, dashes or spaces in the middle, you can start from both ends (where you had a solid copy) and scanning towards the suspect area in the middle. Playing around with the suspect elements, you can then try to determine by contextual clues, if there is an inter character space at all in the suspect area and if so, where exactly it is. This will help to reduce the possibilities in the contextual search.

>Remember, with non-
>coherent Morse, you aren't even sure you are sampling during an
>element interval at this point, so the soft decision isn't really
>telling you anything useful.

When receiving Morse code sent with an electronic keyer, it does not take a lot of characters to determine the dot rate and then rescanning

the message with the correct dot rate and only have to adjust the bit time with +/- 0.5 dot time for each character or word (depending of the habits of the operator). To effectively decode signals sent with a straight key, you need a much larger sample to determine the "fist" of the operator and then rescanning the message from the beginning.

>there are ALOT of combo's ALOT. so the chance of you finding it would be
>remote.

An exhaustive brute force search would take much too long, even for a supercomputer. But you can take advantage of certain regularities and peculiarities to drastically reduce the search space. You still need the equivalent of a Cray 1 to do it quickly, but as Phil Karn noted recently, a Pentium Pro *is* equivalent to a Cray 1. These systems offer security against the belt clip scanner enthusiast, but they don't offer provable security against a cracker armed with an increasingly common desktop computer and some knowledge of the characteristics of the system under attack.

There are provably secure methods of voice encryption, but these systems don't use them. That may change in the future, it's technically feasible now. I suspect the Federal eavesdroppers don't want local police, or other federal agencies, to have provably secure communications, and I know the Feds don't want the average citizen to have it.

(One in seven of us work for government, and the eavesdroppers would like to be able to keep an ear on those folks too, so they have a problem. They have to leave their own systems vulnerable to outside attack if they want to be able to commit inside attacks against them.)

We've come a long way from Secretary Hull's admonishment that gentlemen don't read other gentlemen's mail. Now the "gentlemen" want to read *everyone's* mail and files, and eavesdrop on their conversations, including those of their colleagues.

I don't know how high this tower is... but you are going WAY too deep

Unless you nave need to go that deep for most towers of a modest size a
4ft by 4 ft block of cement is all you will need... You may want to dig a
post hole sized section in the bottom of your 4X4 hole down to 6 ft or more
to make you feel good.

One of the Main things to remember is to use Lots of re rod... The steel is
what makes the cement strong.. at it is cheep..

Remember too... to place that cement you are going to have to figure out how
to move it from your driveway to your hole... 1 1/2 yard of cement is
heaver than you think :)

Curt:

Maybe you and Drew could throw that together. He is absolutely obsessed with 3894.5. Since you're not just a simple SWL, why not just jump in on the festivities by checking in? The Stumpjumpers always welcome newcomers! You can help keep the frequency clear of all the QRM, which is what most of the occupants desperately want, but seldom get.

BTW, with Pork Butt at the Orlando hamfest this weekend, the frequency has been normal, save for the "opportunists" who are simply looking for a place to get noticed.

Gary,

You're way too polite ... those are not "gentlemen" ... they're facist
bastards
who want to dillute our rights to privacy to the point where it vanishes.

The Clinton administration has tried several times now to foist it's
"Clipper Chip" and "key escrow" schemes on us ... fortunately they
and the "decency" provisions in the Exxon bill have failed.

However, the facist bastards keep trying to put them forward with slightly
different spins, in hopes that eventually they'l be able to slip one past
us.

If that happens, we'll have taken the first major step towards "big brother
takes
control" ...

Drew:

For what it's worth: NO ONE CARES. Why would ANYONE go to the
trouble to encode and upload a part of ham radio that no decent ham
wants to acknowledge? Idiots like Pork Butt came from 11 meters,
converted linears and co-phased truckers antennas. Instead of
bringing attention to them, the amateur community needs to ignore
them. These are people who suffer from severe RF exposure.

I like reading the newsgroups as much as anyone who surfs the 'net.
But, geez, Drew; don't you think your time would be better spent
advancing your career? A daytimer in Orlando is not my idea of
major-market radio.

As far as pinning the coax, ham transceivers have protective circuitry against such sabotage. At most, it will cause only a temporary inconvenience.

Also, these are "Good 'Ol Boys" that probably live back in the sticks and probably have enough of an arsenal to start their own militia if they're not already a memebr of one. I, for one, certainly wouldn't want to show up uninvited with malicious intentions.

> better to do than to tell me this is illegal (which it is not).

It doesn't matter whether or not it is "illegal." If it saves someone's
life then that is much
more important than whether or not some stupid regulation is followed.

Good luck, I hope you get the mod.

Yes, Morse used the printer's typebox count to determine frequency,
but 1840s prose doesn't map terribly well to the sorts of messages
we typically send via radio. Worse, the most frequently used letters
are encoded with the least amount of transmitted information, thus
making them the least likely to be decoded correctly in noise (the
more information conveyed about a character, the more of it we can
lose without totally being unable to recover the character). That's
a ghastly decision for weak signal work.

With a uniform code, every character is encoded with the same amount
of transmitted information, so frequently used letters are as likely
to be decoded correctly as the least frequently used letters. With Morse,
the least frequently used characters are conveyed with the greatest amount
of transmitted information while the most frequently used characters are
transmitted with the least. Thus the most frequent characters are also
the ones most frequently decoded in error. Bad plan.

>Anyway, the problem with compression and in particular variable length
>coding is that it requires a reliable transport medium, either with a

Sounds like "turbo" coding. :-)

You're right, scanning and rescanning is a very helpful method of extracting the most information from the signal. The Morse Code's design is *not* helpful in this regard, however. It offers no consistent built in clues to aid the process.

>>Remember, with non-
>>coherent Morse, you aren't even sure you are sampling during an
>>element interval at this point, so the soft decision isn't really
>>telling you anything useful.

>the operator and then rescanning the message from the beginning.

The latter can be nearly impossible with some of the ragged fists heard on the air. Uniformity of timing is essential to good weak signal extraction, and most hand sent Morse is remarkably lacking in uniformity. Even with an electronic keyer, character and word pacing can vary wildly from one letter or word to another. This really hurts the ability to extract the signal from noise. Morse sent from a keyboard buffer is much easier to process in noise than hunt and peck text, and that's better than hand sent text.

Doesn't one part of the amateur regs permit communication by "any means
available"
during an emergency situation?

I was contemplating loading the local PD freqs into my portables in case
something
really bad happens. If I end up saving someone's life, even if I lose my
license, it
would be worth it anyway.

I think I've inadvertently stumbled across "Ham Radio's Dirty Little Secret" here. Judging from posts like these, and a good portion of my e-mail, hams do not want it to be known outside their own little circles that operators and operating practices like those heard on 3894.5 and 14.313 do indeed exist. They're too busy criticizing no-code Techs and thumbing their noses at CB'ers to acknowledge their own mess on 75 & 20m, let alone DO something about the problem. "The amateur community just needs to ignore them." Yeah, and hope that nobody else finds out about them, lest 'the amateur community' ends up looking like major-league hippocrites as a result.

Your database is outdated. WOTS/1220 does now have nighttime authorization, though at a lower than sufficient power level. As for the market, it's #38 and growing (just moved up from #39) and has consistantly been rated as one of the best places to live in America. That's good enough for me.

Yes, the silence was eerie last night! But never fear...the Orlando
HamCation is now history (was a GREAT show, BTW!) and Pork Butt will be
heading back to SC tonight. I look forward to hearing him on his mobile
and having things get back to "normal" on THE ZOO later this evening!

> differ.
> Mmmm.... Wonder what else is wrong!

Look carefully at Table 2: E receives 144-146 and 430-440, while E3
receives 67-180 and 400-512 MHz.

It appears there is no way to get the 800 MHz band on "K" (U.S./Canada)
models, which should make Newt Gingrich happy.

Page 16 appears to be missing from the JPG images.

SB DX @ WW $OPDX.292
Ohio/Penn DX Bulletin No. 292

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 292
BID: $OPDX.291
February 17, 1997
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, KE2VB, N2MAU, K4RB, W4BYG, NL7TB, WX7K, BV/N0IAT, 9K2HN, DJ5AV & DX News Letter, DL8OBC, EA5BY, EI6HB, F5SHQ, F6AJA, G4BUE & DX News Sheets, ON6TT, PS7AB, XE1KK, YV5AMH and ZL1ANJ for the following DX information.

3A, MONACO. The "DX News Sheet" reports that Manfred, DJ7RJ, will be active March 3-13th, as 3A/DJ7RJ while on holiday. Activity will on CW/SSB and 40-10 meters, with a possibility of operations on 160 and 80 meters if he finds the space to erect antennas. QSL to home call.

8B (or will it be YE8), TUKANG BESI ISLAND (New IOTA). Reportedly, everything is a go. Activity will begin March 7th at 0000z and will end March 9th 2400z. Tjork, YB0RX, and others have added another operator to the team (a CW operator). Callsign is still not yet known at this time, 8B8WI is the requested one, but Tjok stated some difficulty with the authority for using a special prefix, so they may have to settle with YE8 prefix. The team hopes that an IOTA number will be issued on the first day. Operations will be from Wanci Village on the Island of Wangi-wangi in the Tukang Besi Islands Group, with activity on 80-10 meters (including the WARC Bands) CW/SSB. QSL is via YC8KAR.

9K/NLD, KUWAIT NATIONAL AND LIBERATION DAY AWARD. On February 25th and 26th (every year) the state of Kuwait celebrates its National and Liberation Day. To mark this auspicious event, Kuwait Amateur Radio Society is delighted to announce an international award for Kuwait National and Liberation Day award. Two stations will be active during these days signing callsign/NLD (Look for club station 9K2RA/LND). The contest is open to both licensed radio amateurs and SWLs. ADDED NOTE: Details of this event will be sent to all OPDX InterNet Subscribers as an additional bulletin.

BV, TAIWAN (160 METERS). Chung, BV4ME, and Leo, BV7FC, have been reportedly active on the lower bands including 160 meters. No times

were provide for Leo on 160, but Chung has been here often on 1828 kHz around 2000-2230z. QSL both direct to their CBA.

BV9, PRATAS ISLAND. Joe Fitter, BV/N0IAT in Taipei, Taiwan R.O.C., reported the following this past week: "Had a nice discussion with several of my Taiwanese/Chinese hams during the Chinese Lunar New Years holiday. One of the topics of discussion was the upcoming DXpedition to Pratas Island, one of the newest of DXCC countries.
It is with a sad note that I must report that the application to revisit Pratas Island was rejected. Citing military preparedness, the officials rejected the application for a return to the island for DX operations. So, at this time, there is no plan for a return to Pratas Island during the first half of 1997.
For those not aware, Pratas is one of the Republic of China's strongholds and it is primarily an island of military installations, and not for civilian use. It was with great privelege that the BV9P operation(s) were able to occur on Pratas. It is with hope that a future operation to Pratas will be realized, either in the second half of 1997 or early 1998....."
Regards, Joe Fitter, BV/N0IAT

D4, CAPE VERDE. Didier, 6W/F5OGL, and Christian, 6W1QV, will try to be active from here Februay 26th to March 4th.

EA8, CANARY ISLANDS. Angel/EA3ALD, Manolo/EA8ZS and Tony/EA5BY will be running the CQWW DX 160 SSB Contest with the callsign EA8ZS. Before and after the contest, they will be using EA8/own call. If someone needs EA8 on any band/mode, they will accept skeds during the evening hours. Send request to: agaliana@alc.es

EK, ARMENIA. EK6GC is currently active on 160 meter SSB (no times of activity were given). He will also be active in the CQWW 160M SSB Contest. QSL to P.O. Box 25, Charentsavan, 378562 Armenia. Internet E-mail address: ampr@arminco.com

HP, PANAMA. As we reported several bulletins back Gerard, F2JD, would soon be active from here and now Gerard has been issued a callsign and is now active as HP1XBI. He will be active from 40-15 meters (including the WARC bands). Gerars will try to activate some of the Panamnian coastal islands, as usual. QSL via F6AJA.

J2, DJIBOUTI. Dominique, F5RYC, is reported to be heading back here and will be active as J28YC. QSL via F6EJI.

MU0, GUERNSEY. Mathieu, F5SHQ, reports to OPDX that he is now active from here with the callsign "MU0ASP". He will be there for a few months. He is active on 20, 30 and 40 meters mostly on CW. QSLs are "OK" via bureau or direct to: Mathieu Roche, F5SHQ, 4 cours de la liberation, 33000 Bordeaux, France.

QSL NEWS AND INFO......
Felix, DL8OBC, states he has been receiving quite a few QSL requests for stations that he is not the QSL manager for, particularly for Bosnian stations. Felix says, "When Bosnian stations were first issued

the T9 prefix in 1993, I agreed to handle QSL requests for T93M, T94IW, T94ON, and T97M. In the meantime, I have handled well over 10,000 QSL requests for these stations, both direct and via the bureau. Much of the work was done by Mario DL1FDV, Mike DL4FMA, and Danny DL5FDA. I'd like to thank them very much for their great help and support! In the meantime, the situation in Bosnia has improved, and the country can be reliably reached via the postal service. A Bosnian QSL bureau is operational and is said to be working well. For this reason, I do not handle QSL requests for any Bosnian stations any longer. Please do not send me any cards for T9 stations, as I will not be able to answer those QSLs. Here are the currently valid QSL routes for some of the more active Sarajevo stations, to the best of my knowledge:
T93M - Daniel Horvat, Grbavicka 53-6, 71000 Sarajevo,
Bosnia-Herzegovina or via K2PF: Ralph G Fariello,
23 Old Village Road, Hillsborough, NJ 08876, USA
T9DX - Sarajevo Contest Group, P.O. Box 61, 71000 Sarajevo,
Bosnia-Herzegovina
T94IW is no longer active. T94ON upgraded his license class and is now T99S. T97M has not currently appointed a QSL manager, so cards should probably be sent via the Bosnian QSL bureau."
Felix mentions he will still answer QSLs for all of his own stations which he is QSL Manager of via the QSL bureau or direct to: Felix J. Riess, DL8OBC, P.O. Box 1253, D-30984 Gehrden, Germany.....

Those who worked EI7M, which took part in the ARRL CW contest this past weekend, should have their QSL Cards sent to: Denis O' Flynn, EI6HB, Ladysbridge P.O., Ladysbridge, Castlemartyr, Co. Cork., Ireland.

5X1XX, 5X1HR, 7Q7JH, and KF7E/ V5/A2/Z2 QSLs. Jim, KF7E, states he would like to close out the logs for these stations, and wishes to make a final call for those still needing the QSLs. There was one interruption in the QSLing for direct cards to K7UP and KF7E, and one lost or misplaced batch of bureau cards for late 1995/early 1996. All errors, ommissions, and special requests should have been taken care of. The last big batch of bureau cards went out at the end of 1996, and Jim has one small batch of direct QSLs to mail out; these cards will go out by the end of February. Please give the bureaus a chance; they are very busy. Jim has received in previous bureau deliveries multiple QSL requests from the same stations, sometimes 3 for the same QSO. If you sent Jim a direct request and have not received a reply by the end of March, please send an E-mail message to him (jhenders@tdrss.wsc.nasa.gov) or send another request mentioning this communication, and he will double check for you. Otherwise, he intends to pack up the piles of QSLs and logs and store them by April 15, 1997.

USI ALERT. Dave, K1HT, will be active from Cumberland Island GA-002S on 14260 kHz from February 17-21st. QSL direct to K8JLF or bureau via K1HT.

V31, BELIZE. Members of the Cuba Libre Contest Club, John/W2NA, Vic/KI6IM and Bill/WA9L will be active as V31DX during the ARRL DX Phone Contest. Activity will be on 160-10 meters. QSL via AA6BB.

V5/ZS6YG OPERATION. Operators from Colorado -- KV0Q, W0YG. WB0HBS and W8UVZ should be QRT by the time you read this. As of Thursday last week, the team passed out about 700 QSOs on 160 meters. The team has reported that contacts were difficult due to area storms which caused static and high winds. They were using an inverted vee on 160m with apex at 260 feet using 60 ft mast on top of 200 ft high lighthouse on the Atlantic coast.

VP5, TURKS & CAICOS ISLANDS. If you do not have a chance to work Joe, K8JP, this past weekend during the ARRL DX CW Contest as VP5JP, you will have a second chance this coming weekend during the CQWW 160M SSB Contest (February 21-23rd).

WHAT HAPPENED ON KERGUELEN? OPDX InterNet Subscribers will receive an additional bulletin containing the details (by Peter, ON6TT), why the VK0IR team did not operate from here.

WP2, VIRGIN ISLANDS (U.S.). Operators KE2VB, K2ZJ and K2ZL will be active as WP2Z during the ARRL DX Phone Contest (March 1-2nd). The WP2Z will be a Multi 2 entry for the contest.

XE, MEXICO. Ramon, XE1KK, informs OPDX that once again the Radio Club Satelite, XE1RCS, will be active in the CQWW 160M SSB Contest as a Multi-Op/Single Transmiter entry. The group has installed a brand new 1/4 wave vertical, two dipoles, and 6 beverages which includes running full power. A lot of planning and teamwork has been made for this contest. They hope to do better than last year placing 6th in the world. For more information contact Ramon at "xe1kk@amsat.org" or visit their WEB site: http://www.xe1rcs.org.mx/

XT, BURKINA FASO. Ray, W4BYG, states he will be traveling to the French part of western Africa, from February 18-25th, and may possibly extend his stay another two weeks. He will signing XT2AR and plans to be on or about 14195 or 14245 kHz after 2100z, each evening. He will be running a FT-757 to a ground plane. He may also try 40 meters if conditions are not good. QSL via W4BYG.

YV0, AVES ISLAND. "Rumors of a DXpedition to Aves Island this summer are not true", states Reinaldo, YV5AMH, President of the Radio Club Venezolano and Vice-President of the Venezuela DX Club, "no plans for Aves Island this year. The closest date is March or April 1999."

ZL, NEW ZEALAND. Look for operators Tapani, OH5BM, and Martin, ZL1ANJ, to be active as ZL1ANJ as a MultiOp-Single Transmitter enrty in the ARRL DX Phone Contest. Operations are planned to be on 80-10 meters.

ZK1, SOUTH COOK. The "DX News Letter" reports that VE6JO is expected to be active from February 22nd until March 10th. They state he holds a valid licence, but he has to borrow equipment on the island.

ZL7, CHATHAM ISLAND. The DXNL also reports Lothar, DJ4ZB, has been active since February 4th as ZL7ZB. He will stay there until March 13th (?). Lothar works in phone only from 80-6 meters. QSL via homecall.

ZY0SG/ZY0SK OPERATION. The St. Peter and St. Paul Rocks DXpedition is now QRT! Last QSO was logged at 1015z. Despite the great difficulties, Tino and Karl made almost 10.000 QSOs.

Jeff,

I'm not sure of your thrust here. Is the implication of CW in the
backgound that the US military is using it. Frankly I doubt that, but
it might well have been an intercept. After all those planes have a lot
more capability than just being a mobile air route traffic control
center.

I checked my pages and indeed we don't have page 16
What i don't understand is that all pages i have are just like i
received from Kenwood and they are one part.
No way they could "forget" page 16, i think it's a mistake in numbering
the pages sins page 15 and 17 are one.

I ask them for it and let you know.

William

3718. Colinear 2m Base Antenna...anybody have one?

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-16 00:00:00 UTC
From: mnmaniac@aol.com
Message-ID: <19970216231301.SAA10564@ladder01.news.aol.com>
Source record: 204529

Lotsa interesting stuff at the Orlando HamCation this past weekend. One product that caught my eye was a 5/8 wave over 5/8 wave colinear base antenna. Four foot fiberglass base, 3 foot top whip, and groundplane radials with U-bolt and standard SQ-239. They claim 6.5db gain and were selling them for $29.95. Manufactured by the Lakeview Company out of Anderson, SC.

I almost bought one of these, and I'm wishing now that I had. Seems like a very reasonably-priced alternative to Comets, Diamonds, etc., with similar gain ratings and price tags of around $150. Anyone have one? Comments? Is the 6.5db gain rating realistic or exaggerated?

>terms, a dot is (111111100000), a dash is (11111111111100000), a
>letter-space is (00000000000) and a word-space is "longer than a
>letter-space".

Well, lets clarify this a bit. OOK has two states, call them 1 and 0,
but there is no information transmitted about the 0 state. That we are
in a 0 state has to be *inferred*. This costs us 3 db compared to a
system which transmits energy for both states orthogonally (or 6 db if
the states are transmitted antipodally) against a gaussian noise background.
So OOK has a deficit in performance versus better modulations. That holds
whether the encoding of characters is done in ASCII or Morse.

In fact some clever tests have shown that humans can be trained to understand FSK modulated Morse under weaker conditions than they can OOK modulated Morse. This isn't just a machine decoding artifact, it is universally true.

Now any encoding which uses a binary transmission medium has to depend on timing to convey more than a single 1 or 0, yes or no, mark or space statement about its condition. Morse requires information be conveyed about when timing edges occur, and what state the system transitions to at that moment. Other codes, such as Manchester, don't care what state the system is in, only that a transition has occurred at a particular time.

We can copy Morse with a sounder because we get a distinctly different sound when the sounder transitions from the 0 to the 1 state than from the sound we get when the sounder transitions from the 1 to the 0 state. The order of the "click" and the "clack" give us transition *direction*. If we were copying Manchester code by ear, all we'd need is the "click" to tell us a transition occurred. We wouldn't care which direction the transition took. This is useful because it reduces the amount of state information we *have* to recover and retain to make a decoding decision.

Uniform codes provide these transitions at intervals which can be precisely determined a priori, Morse does not. This is a major win for the uniform code in a gaussian noise environment. That's because we can tailor a perfect matched channel filter for the uniform code. We cannot do that for a variable length code like Morse. This perfect matched filter maximizes Eb/No, and hence our probability of making a correct decoding decision.

>You may have noise in the sampling instances, but the ADC usually samples
>much more frequently than the human hand sends the code. Dashes have more
>1's than dots and about the same number of trailing 0's; letter-spaces have
>more 0's than dots and dashes and word-spaces have more 0's than all the
>others. It's just a little adaptive filtering; there are known average
>dot, dash, letter-space and word-space that can be used as starting points.

The ADC *must* sample faster than the code is sent. At minimum, it must obey the Nyquist limit. Now the faster we sample, the more *noise* we sample, because noise has a gaussian distribution. During the 0 intervals, *all* we sample is noise. During the 1 intervals, we get noise plus signal in our sample. To maximize correct decoding probability we have to maximize the ratio of signal energy to noise energy, IE Eb/No. We can't do that during the 0 periods, because all we get is No/No. Thus the 0 periods don't contribute to information about the signal in a positive fashion.

Now we can attempt to use adaptive filtering on the signal, but there are several frequencies we must filter, not just the one of a uniform code. Let me illustrate this using your notation. A dot is 111111000000. That is a symmetrical signal and can be resolved to a single discrete frequency, IE a Fourier transform will show a single energy peak. We can form a matched filter around that frequency, and resolve it maximally against gaussian noise. But now we have the dash, it is 111111111111111111000000. That is *not* symmetrical, and when we

Fourier transform it, it does *not* resolve to a single frequency around which we can form a matched filter. The filter we can form will have more noise energy than the filter we formed for the dot.

You say that's Ok, the dash has more signal energy than the dot. That's true, but now lets see what happens when we mix dots and dashes. To the dot filter, the last 12 intervals of the dash look like a perfect dot. It is going to declare to the decision circuit that a dot is present. The dash filter is going to declare that a dash is present. The decision circuit is not offered a clear choice. Now lets look at the reverse case. Lets have two dots transmitted. 111111000000111111000000. The dot filter is going to declare two dots, but the dash filter is going to report a 66.67% probability of a dash being decoded, IE a somewhat corrupted dash. The decision circuit must choose, was it 2 dots, or a channel impaired dash? It has no good information on which to base a choice. This is why multiple symbol lengths pose a decoding problem.

And finally, we *cannot* form a matched filter for the space states. Any filter we form returns a uniform DUH! because there is no way to discriminate between a letter space or a word space or an intracharacter space against a channel fade or other impairment because *no* signal is being recovered. It is all the same gaussian spectrum in each case.

>The QAM-like constellation I was referring to is what you'd get after
>sending this VLC through your sample-and-hold/periodic-integrator. You
>would need to bias the decision threshold so that dashes appear above dots
>above the "zero", with the letter-spaces above the word-space, both below
>the "zero".

But you *cannot* do that. You don't have any basis on which to discriminate, you have no idea where to set a slice level, and the spaces all resolve to the same value anyway.

>It's all software and very sharp band-pass filtering. ;-)

There's a computer term which applies here. It is GIGO. Without a clear basis for decisions, you might as well flip a coin. Now you *can* form a basis for decisions if you can recover a clock. This allows you to align your samples with the various timing states of Morse, and lets you *build* a decision tree which will lead you to the correct decodings. The tree will be impaired by the reduced Eb/No because of the inability to form a single perfect matched filter, but it will work if the SNR is good enough.

Once you get past the deficits encountered by using OOK and by the inability to form a perfect matched filter, clock recovery is the *major* problem of a code like Morse as compared to a uniform code. Clock recovery, and clock *phasing* is a daunting problem with a variable length code. It can be hard enough with a uniform code buried in gaussian noise. It can be darn near

impossible for a hand sent variable length code.

Note that again this is not just a machine decoding artifact.
A human faces the same quandry trying to determine where signal
edges occur against a gaussian environment.

>Yes, signaling systems like QPSK are significantly more efficient, IF you
>have the equipment to encode and decode the signals in the first place.
>The beauty lies in the fact that you don't NEED a computer to encode or
>decode CW; it's the most "flexible" human-computer, computer-computer,
>human-human information transmission mode I know of. Voice wastes
>bandwidth, voice-recognition on a computer is MUCH more computationally
>intensive and computer voices leave a great deal to be desired. I propose
>we convert all voice bands to digital and keep the CW portions since
>obviously they are far more efficient. (Just kidding. hi hi :-)
>
>It's all a matter of perspective. Most people I know can't listen to an
>ASCII bit stream, even at slow speed, and determine what the computer is
>transmitting. ;-)

That's because they've never *tried* it. If you spent as much time
and effort conditioning the wetware to copy a slow ASCII FSK signal
as you spent conditioning the wetware to copy OOK Morse, then I
contend you'd be able to do it, and be able to do it against a
harsher gaussian noise background. Signaling and information theory
say so, and some human perceptual experiments tend to reinforce that
conclusion. Though I wouldn't choose ASCII as an ideal code against
the gaussian noise either. There are even better codes which can
be used against that.

There are basically three reasons why people don't do that.
1) Machine modes are generally sent way too fast for human decoding.
2) It never occurred to anyone to try since machines did it first.
3) And machines do it faster and with a lower BER than humans ever
could anyway, so why bother?

I believe that if all our text encodings were sent as slowly as
Morse, we would quickly abandon Morse as inferior. It is an artifact
of history that Morse came before the better codes, and that the
better codes were first used at much higher speeds via machines.
Today, there is little point to slowing the superior codes down
to speeds humans can handle because the machines to do it are
obviously faster and widely and inexpensively available. Morse
hangs on as a regulatory artifact of distant times.

My complaint about Dave Bushong

Parts of what follows below were actually painful to write. However, because of the ongoing misinformation campaigns launched by Dave Bushong and his devotees, I feel it is my duty to write this. There are a number of reasons Dave isn't telling us as to why he wants to disguise the complexity of color, the brutality of class, and the importance of religion and sexual identity in the construction and practice of fanaticism. In this letter, I will expose those reasons one-by-one, on the principle that I would rather die than remain silent in response to that which I am convinced is profoundly hopeless. Also let me say that I speak from experience. Be forewarned: The abusive aspect of his attitudes will create a stir between smarmy illaudable-types and the huffy public at large. Let me back up a little: Some of his rantings raise important questions about future social interactions and their relationship to civil liberties. It's really hard to take someone as parasitic as Dave very seriously.

You know what I mean? It would please him greatly to worsen an already unstable situation, and deep down in our bones, we all know why. Okay, now it's time to offend a few people. Actually, I hope not to offend anyone, although he can't discuss anything without talking about incendiarism. Dave apparently wants to use us to fulfill his sick mission, period. He is devoid of all social conscience. One can examine this from another angle, and plainly see that innocent children have been brainwashed by his closed-minded assertions. Strictly speaking, his little schemes are bound to fail. This is a transparent attempt to hand over the country to gloomy demonic vermin. You'll never hear Dave admit he made a mistake.

His sermons need to be reassessed with his ulterior motives in mind, right? His followers are villainous at best, the downfall of society at worst. In a manner of speaking, his minions have cooperated closely with the worst types of delusional vindictive yobbos there are on several projects. Think of Dave's declamations as being the sum of two components: a slaphappy component that consists of Dave's desire to repeat the mistakes of the past and a callow component that consists of everything else. We are concerned primarily with the former. To sum it all up, Dave Bushong is incapable of empathizing or identifying with others.

If the 90 is like the 92 EX, you have to remove the ashtray and drink-holder assembly and unscrew several screws from the bottom. The plastic pocket then pops out. (As I recall, I also had to loosen, but not remove the stereo.)

Unfortunately, I have found that with Hondas, one has to remove several items before getting at the one you *really* want.

Dear Fellow Amateur,

An Internet Web Server devoted entirely to Amateur Radio and associated hobbies.

If you would like a home page of your own or for your Radio Club it's absolutely FREE and will always be FREE.

This is my private computer system with the Server on a T1 hi-speed network. It's a hobbie for me
just as Ham Radio is and I'm glad to share my system with everyone.

This is what you'll get:

E-mail account that you can use locally or have forwarded to your regular account

Example: K3TKJ@qsl.net , NE3Y@qsl.net , YOURCALL@qsl.net

FTP privledges

Telnet privledge (after you convince me you need it)

Your own personal Web site....Try these working pages now.

http://www.qsl.net
http://www.qsl.net/k3tkj
http://www.qsl.net/kc8eds
http://www.qsl.net/ve7fym
http://www.qsl.net/n3wdl

Here are the rules:

1) NO COMMERCIAL USE!

2) I'm not going to write the page for you. Isn't it time you learned something new?

3) You have an Amateur License.

That's it.... If you want to try it signup at http://www.qsl.net

Need more info? E-mail: k3tkj@qsl.net

Well, aren't we self-righteous today! In any event, as it happens I do own a marine radio. It is not portable, and is attached to my large boat. Therefore, it is not suitable for use in a small boat of the sort I rented on my last vacation. The FT-11 was much more appropriate, and, when the engine conked out in my rental boat in the middle of Puget Sound, I was able to call for help! So sorry I didn't use a "type approved" radio- I suppose it would have been much better for my family and I to row the ten nautical miles or so to the coast. In addition, Jeffrey, you really don't have the slightest idea what you are talking about with respect to performance- I have a fully equipped radio communications shop including a Service Monitor and both a HP and Advantest spectrun analyzer and shielded room. I've looked at both of the radios with respect to deviation, spurs, and frequency stability- they are fully the equal of my Midland marine radio. In fact many of the ham rigs are based on commercial designs or vice versa- for example the IC02 and the essentially identical Aircraft HT's.
So go mind your own business Jeffrey.

>14.313 do indeed exist.

No Spew, that's not it at all. You obviously don't have any children (which
is probably a good thing for the human genome, when you get right down to
it...) When your child throws a temper tantrum, the last thing that you
do is acknowledge it. The action (like those actions on 14.313 and 3.894)
are simply cries for attention.

The theory is, of course, that if you ignore them eventually they will
go away. You are, apparently, the exception to the rule.

>Yeah, and hope that nobody else finds out about
>them, lest 'the amateur community' ends up looking like major-league
>hippocrites as a result.

Yeah, we really have numerous bills in Congress trying to get them
to outlaw scanners capable of receiving those frequencies, alright.

>WOTS/1220 does now have nighttime authorization....

Has the local gay community in Orlando been actively picketing WOTS/1220
regarding one of their employees' very vocal bigotry? Hmmm... Perhaps
they don't know about it...

I would like to use my 79A as the remote to my 733A.

I followed all the directions in the Appnotes. I power on while holding
PTT and MR and nothing happens.

Any suggestions would be great.

Thanks, Mark, N1XYY

Anyone wishing to register opposition for the ARRL/AMSAT submission should send a brief e-mail message to wrc97@fcc.gov. The Subject line should say "Reference No. ISP-96-005 IWG-2A." A simple statement to this effect, "I oppose the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal," will be included in the public record and will help to drive home the point that there is broad-based approval to well conceived 2 metere sharing proposals. It ought to be clear to the FCC the public good is poorly served by allowing hams exclusive use of these valuable
frequencies.

Please note! The proposals the League opposes are not FCC proposals, nor are
they endorsed by any other branch of the government. They are industry proposals. The League's objective is to falsely demonstrate there is broad citizen opposition to the industry proposals.

Additional arguments or evidence also is welcome. Important! Comments should
reach the FCC no later than March 4, 1997!

Does anyone know an equivalent to Heathkit's 10.7 MHz IF transformer
used as T 301 and T302 in the HW9? Heathkit part number 52-193.
Presumably it has a Toko equivalent? Thanks.

G4JQT

YOu can also rent electronic POLE HOLE DIGGERS that will dig holes
from local rental companies..about 30-50 bucks a day

or try a shovel...

or have a tower rasing party and have your buddies bring tools an take
turns digging...i did this ..i supplies the burgers and dogs they came
with the liquid refreshemnt of thier choice an we dug 4 0r 5 in the back
yard...xyl had a fit....

DON good luck an 73

So do you cut legal corners in all aspects in your radio shop
business, or just with your own personel communications?

My comments were directed to everyone who has asked (or will ask
in the future) "How can I modify my radio to xmit out-of-band?"
None of those posting such queries have a fully-equipped radio
shop such as yourself to analyze the results of their modifications
(they wouldn't be asking for such info in the first place, yes?) -
that you're encouraging people to screw around with their
radios without them having the means to check their actions is
morally wrong. If their radios cause problems to other services
(as a result of your suggestions) and they encounter trouble with
the authorities, in their own defense they'll certainly mention
your name ("He told me how to do it!").

I have to wonder about the validity of your radio shop claims -
you said "... cut some <colored> wire..." - that was rather
vague for someone with their own radio shop business.

>So go mind your own business Jeffrey.

That will never happen.

Do you also cheat on your taxes?

73,
Jeff KH2PZ

>Can anyone (without spending time searching themselves) provide the URL
>of a site with the information I need?
>Many thanks in anticipation.

Well here's an old-fashioned suggestion: Send a letter to each and
every country's national amateur radio organization and compile the
data yourself. Then post the info on your own web site. Ask each
organization to keep you updated annually (possibly via email if
they have access). Then your web site will be the one we'll all
turn to for such info! You can also collect such data as to what
various license classes they have, what privileges come with each
class, and what the requirements are for each class. *That* info
will supprise many folks!

The IARU should be able to supply you with addresses of all the
world's national amateur radio organizations. Hopefully most will
have an email address.

If Drew is acting as a mirror, then he's parabolic in shape focusing on
one particular freq'y. A true mirror reflects all that passes before it.
I've *never once* heard Drew speak of the 99.9% of operators who are the
true ladies and gentlemen of our hobby/service, abiding by all regulations
in their day-to-day QSOs.

Ah! Now, at last, we are getting to the nub of the matter!

However, such individuals usually describe their role rather
differently. They see themselves as "devoting their lives selflessly to
the service of others and to the furtherance of amateur radio ... a
thankless task, but someone has to do it (etc, etc,)" [Segue into
strains of violins ....]

I had the same problem also!! Kenwood used a sticky substance on the
Display PCB to keep all the components from coming off since the radio
was a mobile radio. The problem is that the sticky substance starts to
conduct after a year !!! You have to take the radio apart and soak the
pcb in alcohol to remove the substance. then put back to gether . It
works !!!

True, but the mean value of a "0-state" is of zero energy, while the mean of a "1-state" is non-zero/above-threshold energy ((A^2)/2). I'll tackle this bit a little further on.

Getting a little philosophical, the lack of information is information in itself. Yes, I'd much prefer to use something other than OOK, where the low and high states are distinguishable, but on the transmitter side of things, transmit/no-transmit is better (in terms of over-all power consumption) for, say, a QRP set-up, than transmit/transmit/off of other modes. That is assuming all other factors are equal, which they rarely are anyhow. :-)

> In fact some clever tests have shown that humans can be trained to

> OOK modulated Morse. This isn't just a machine decoding artifact, it
> is universally true.

Oh, no doubt about it! As a musician myself I can fully appreciate this. The human ear is quite the versatile tool when trained. Half the battle is coming in on cue after several bars of rest; "playing" the rests.

[stuff about uniform codes deleted - all very true]

> contribute to information about the signal in a positive fashion.

I think this is where our perspectives are differing somewhat; I don't think I was clear in what I was trying to get across. What I was trying to say was that the sampling rate is significantly higher (by several orders of magnitude) than the morse code symbol rate (dots, dashes and both spaces); oversampling can work wonders.

Yes, you are sampling more noise, but that noise is (usually) of zero mean relative to both OOK states. If you average the samples over a sufficiently small (so you don't kill the actual OOK signal) moving window, you'll knock out a great deal of that noise. That gets rid of the "pure" noise; after that you just pass the signal through a very tight BPF to knock out the adjacent signals, square the resulting values to get them positive and use the resulting "rectified" numbers as your bits/no-bits values based on some energy threshold. It's these bits/no-bits values that you use to generate your decision Markov chains; Neural Networks, Kalman-Bucy Filter, <insert_algorithm_here> from here on in.

[other true communications facts deleted]

> perfect matched filter, but it will work if the SNR is good
> enough.

Have to disagree with you on this one. A fair coin tells you nothing, but any bias will show up over time if your algorithm/filter is designed to accommodate the temporal variance. We already know ahead of time that we expect to see four discrete symbols evolve over time. One "coin" is dots versus dashes, the other is letter-spaces versus word spaces. Morse code symbols themselves are your clock. No one said it was going to be easy. :-)

By the way, wasn't the original question asking how to build a better algorithm for decoding morse code? We've gotten a bit side-tracked, but it's been fun. :-) Think we've scared off the original poster?

Andrew.

Come on, Burt....
Let me see ---- public service events (bike races, marathons, sporting events, Special Olympics, APRS at the real Olympics in Atlanta, etc), search and rescue communications (whether on foot, in vehicles, or in the air), coordination of communications for emergency management agencies (from city/municipal to FEMA), and what about hurricanes, tornadoes, wildfires.....

Is that enough or do you need me to waste more bandwidth trying to convince you of something the rest of us acknowledge.

Doesn't say very much about your example, does it Burt? Are you
telling us that you are such a poor teacher and such a poor example,
that you can not guide your students to the more interesting,
productive areas of ham? Please don't say there are none, you and the
rest of us know that that is an outright lie. Of course, if you truly
believe there are NO redeeming features in amature radio, then that
would prove that you are not a good teacher, or at the very least,
lack the knowledge and drive to be a "good" teacher. All that said,
I'm not stating that you are not a good teacher, like I said, it could
simply be that you are spouting bilge and nonsense for some strange
reason known only to yourself.

>It is a vast wasteland.

If your above example shows your ability to motivate our youth, could
it be possible that the same could be said of your classroom?

>Hams can not ignore.

Why should hams ignore? I, personally feel, that is one of the
problems in ham radio. We ignore TOO much. You yourself have
mentioned this. Please make up your mind on how you feel it should
be.

>No you do not. If you find ham radio interesting you will love watching
>water freeze.

You have NO room to talk, Burt. YOU are guilty of being exactly what
you accuse others of being. You are still the UTH (remember that
one), you just use internet instead of ham. I find this interaction
interesting, but it is definitely more boring than talking to someone

live, on air. If this is you idea of interesting, then maybe you'd find watching water thaw fascinating. A "typical ham" (your definition) is still a "typical ham" whether it be via radio or internet>

Your example doesn't lead me to conclude that there is a problem
with the people signing up for no-code tech. Rather I believe that
it continues to emphasize the problems the ARS currently has with
its testing and licensing structure and the message that the current
policies and current hams convey to others.

There are lots of hams with many years tenure and 1x2 calls that
are quite frank in considering it a hobby and that their only purpose
for their licenses is to "yack". Forget technical advancement, they
think it is a farce (except for the hams who are practicing engineers)
and forget emergency comm, they think cell phones do it better. A
selfish purpose for the license is not unique to non-coded hams.

> and said, "Yeah, I know what you mean. Even when they aren't talking
> about radio they as interesting as watching grass grow. They should
> get off their butts and do something fun." They first guy responded,

Maybe they're right here. *Talking* about radio does get boring after
a while. *Doing* something new, different, or innovative, in radio
technology *or* applying standard radio technology to something new,
different or innovative, *is* more fun. Further, nothing about being
a ham says that it must be their primary interest; but many other
activities can be enhanced by the use of their ham privileges. If
their primary interest is wind-surfing, maybe they'd be more interested
in radio technology if it was pointed out that they now had licenses
which allowed them to put together an automated wind reporting station
on some lookout point.

> "But, God, this is sure cheaper than cellular. That test was so easy.

$20/month non-prime-time cell phone billing programs and $0.01 cell
phones compared to $200-400 HT's, $300-800 mobiles, and $10-20/month
autopatch fees (in large urban areas) make this a questionable assertion,
particularly when you consider that everyone has a phone number and not
everyone they want to talk to has a 144/440 HT. Not necessarily smart
if that was their only reason.

> What a joke. If they're going to give out the answers in advance they
> should get a clue and just drop the test. Like it's going to keep
> anybody out."

The ham tests *are* a joke. The FCC, with ham community acquiescence, gives full privileges in the most active parts of the national radio spectrum, that require the most technical knowledge and expertise to safely and correctly operate, with the most basic and cursory of regulatory and technical tests. For example, a Tech is already licensed to experiment in microwaves, but microwave dish safety isn't even discussed until the General/Advanced tests. Further, the remaining ham tests barely qualify the ham for real experimentation in HF, let alone at VHF/UHF and up. Finally, HF band privileges are added incrementally based on code and broad technical tests, when there is no rational distinction between the use of code or radio technology on one 25 KHz segment of the various HF bands versus another on the same HF band. It would be more rational to have a three tier structure that properly adds privileges based on the tests. For example:

1) Basic level - 144/440 no-experiment/appliance-only transmitter license using the existing Tech test;

2) Intermediate level - add full HF and VHF/UHF privileges + current experimental transmitter privileges using a combined General-Advanced theory test and (due to ITU requirements for now) a 5WPM code test;

3) Advanced level - add the remaining microwave band privileges, VE privileges, perhaps new "self-certifying STA" privileges (i.e., privileged to experiment with new modes on any ham bands without having to process piles of paperwork with the FCC), and perhaps new volunteer band monitor privileges (someone the FCC knows has been tested on the requirements to properly document a notice or even issue a notice) using a real technical test and new regulation elements.

In general all the above technical tests should be computer generated from a larger pool of possible circuit and equation values so that answers can't be memorized as well as having questions that are more technically relevant. Oral or essay formats might be added as well, particularly for the new Advanced.

I've had fun with the thread that's come since posting this rig, but I'm starting to get a little tired of Nutless Idiots such as yourself, littering up the newsgroups and destroying other people's ads. It's okay though, because I have a growing list of boneheads I'm going to be watching very closely for. I'm actually quite anxious to see YOUR next attempt to sell an item. I assure you that there will be more attention drawn to the outlandish prices instead of the equipment you've posted.

Have a fine evening,

Mike

In article <jlowmanE5rIE3.BMx@netcom.com>,
Jim Lowman <jlowman@netcom.com> wrote:

>First point: Right on the money. Instead of denigrating the no-coders, how
>many older hams are actively elmering the newcomers, as we were elmered when
>we were new?

So Jim, what do you do when the newcomers tell the "old fartz" to "F-off"?

On this newsgroup alone I see a significant amount of intolerance for
the older members of the hobby, as if they were some festering cancer that
needs to be cut out. I have found, with a few exceptions, that most
'old-timers' are more than willing to help newer hams.

This reminds me of a story... One afternoon on Maui I was taking a ride
from my luxurious accomodations in Kihei up Route 30 to Napili Bay and
the village of Kapalua. Being somewhat of a history buff, on the way
over, I wanted to visit an old petroglyph site off the highway just outside
Olowalu. Unfortunately, the site had been closed down many moons ago by
the Hawaii Tourist Bureau due to vandalism by tourists, and no matter how
much I tried to find the turn-off, I just couldn't find it.

After about 1/2 hour of looking, I stopped at a general store just outside
Olowalu, to purchase a shave-ice (those 82-degree days on the islands are just
murder), a few supplies, and see if I could get directions. The establishment
was run by an elderly polynesian couple, long residents of the island
before it became a US state.

Having had bad experiences in the past being a haole, I requested my
shave-ice and got a Coke for my wife, and was very conservative in my
small-talk. As I started cashing out, I asked the elderly woman (at the
register) if she could direct me to the turnoff for the petroglyph
site. She didn't turn from the register, and continued to ring up my
supplies without saying a word. I paid for my items, the woman bagged
them, and I politely said thank you and turned to leave. This entire
exchange took about 3 minutes.

As I was starting turning to leave, she turned from the register and
said "you want to find the petroglyphs, yes?" and stared at me for a
moment with a strange sort of look. At this point, I indicated that I
did, and explained that I was trying to find the turn off but could
not. At this point she explained the turn-off was overgrown, and she
gave me an alternate set of directions that got me where I wanted to
go.

I guess the whole point to this anecdote is that while I was on the
islands, despite hearing people tell me how the island natives were

generally unfriendly to haoles, I found quite the opposite to be true. I found most island residents to be pleasant and helpful, especially if you show a little interest in them and their culture.

I believe the same extends to amateur radio. If you show up in the hobby with a license proclaiming that "code is shit", then expect most hams to ignore or ridicule you. That doesn't make it right or wrong, simply part of the culture.

The best thing we've found is Goo Gone, available from most hardware stores. Made from citrus products, smells goooood, and has never harmed any wood, paint, or other finish we've tried it on. Of coursr, YMMV.

3768. 2m/220 handheld

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-17 00:00:00 UTC
From: Eric Shamay <shamay@edm.net>
Message-ID: <01bafcf5$99fbc0f0$2cb567ce@ERIC>
Source record: 204395

I'm looking for a 2m/220 [new] handheld with a five watt output. I've been looking at catalogs and at the local stores and here's what I've found :
Icom is selling one for about $450 and standard has one at $600
Based on your experience, which handheld would you recommend. Are there any dramatic differences to the different brands, are any brands better for some reason, what features should I be looking for, and what is the approximate price I should be seeing... ?

No Carl, ham radio has degraded to the point that you sit on here and
spend countless hours like some sort of civil rights group looking for
anyone making a comment about no code so you can get you 2 cents in. You
bitch like a red head women.

3774. Re: Why I changed my mind on the code...

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-17 00:00:00 UTC
From: Ron Curry <recurry@insighttec.com>
Message-ID: <01bc1d14$7b0f8f60$5ba19ecd@expressp5.insighttec.com>
Source record: 204401

First of all, please no flames. If you disagree with my opinion than an intelligent and mature rebuttal is all that is required - and please make sure you reply to the group so your opinion gets read and appreciated by all.

I'm a "no-coder" who recently upgraded a few months back to General. Actually, I had passed the General and Advanced writtens at the same time I got my Technician but only recently passed the code and the writtens had expired. So there are some of us who do make the upgrade. I have some interest in the code, if only for the challenge of it and have my TS870S and iambic paddle and am working on my code proficiency. I find it fun but don't spend much time at it because there are so many other more important demands on my time - work, family, etc.

As a tool to "maintain the integrity of the HF bands" and a "right of passage" to gain more privledges I believe the code test is not doing the job. When I scan the HF bands I find the level of conversation even more disappointing than 2m (which I haven't used in some time for that reason). A lot of contesting - "CQDX CQDX thank you w4ab for the contact CQDX CQDX .....". A lot of old guys (nothing wrong with being old we all will get there - hopefully) complaining about their health, how proud they are that they don't use computers, how the younger generation is no good, the weather, trying to rack up the "body count" on the daily net etc. It seems that the code requirement only keeps out those who only have a utilitarian use for radio or those who don't have the time or have more stimulating pursuits to fill the limited time they have.

The code test seems, really, very much like the no-code tech test. It screens for two things persistance (this is good...) because one needs to study and memorize, and time because you need to make the time to do the studying. Neither test has anything to do with how much you know or how good an operator you are (or will be) or your interest in RF technology. Witness your surfer dudes. These tests are simply a measure of persistance and free time (one might reasonably argue that this is a question of priorities rather than free time but it doesn't make a difference)

What is the objective of the code requirment? I submit it once was to ensure that hams had a skill and knowledge set consistant with the technology of the time to keep the level of Ham intellect on the leading edge. I think the current test questions once had a similar objective. However, technology has changed a lot in the last 30-50 years. To be competitive in the communications industry today you need to know about computers, networks, speech compression, channel coding, microwave technology, microcontrollers, digitial design, etc. etc.

Very little if any of this is reflected in the current set of test questions and none of it has to do with the code test. We need to be more pragmatic with regard to how to raise the quality of the ham bands. If you want Hams that are intelligent and conversant on today's technology then you must screen them with tests that are relevant to today's developments. The test pool methodology is fine. It's a proven method that promotes learning just by the fact that one must memorize the questions and answers. The change needed is to ask questions about RF technology that goes far beyond RTTY, 1200 baud packet, SSB, CW, CTCSS, etc. We need to continue to raise the bar - even for those that have had their license for 25 years. That's the reason there is a 10 year renewal cycle. The current General/Advanced test might make a good start for Technician, with some modernization. We need to be asking questions that are forward looking rather than backwards looking. We need to focus on technology and operator technique rather than what the limits of the CW portion of 80 meters is (you can look it up in a book or keep a cheat sheet next to the rig - it's useless knowledge unless you are tuning around the band).

The code has it's place and we should keep it as a requirement for some class of license and access to designated CW portions of the bands. We should recognize those that have the persistance and drive to learn it (maybe a special designator or class or something). However, we need to recognize that the code test isn't the problem with Amateur radio today. It's a symptom. It's a symptom or the much broader and serious problem that the world has left the Amateur Radio Service in the technological dust and we don't have the tools and processes in place to effectively change that.

By the way you could have recommended to the two young men that perhaps they should use the Family Radio Service or GMRS and they wouldn't have to deal with Hams. However, I submit that some users of the Ham bands are better than no users - regardless of their purpose.

Best regards,

Ron

Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.equipment,rec.radio.amateur.homebrew,rec.radio.amateur.misc, rec.radio.amateur.space

Re what was previously posted regarding the ARRL/AMSAT position
on this issue. I would recommend that individuals do their own
research
prior to sending the suggested response. The poster points out that:

"Please note! The proposals the League opposes are not FCC proposals,
nor are they endorsed by any other branch of the government. They are
industry proposals. The League's objective is to falsely demonstrate
there is broad citizen opposition to the industry proposals."

I would ask myself - when did industry ever propose to GIVE any new
frequencies to the Amateur community? As far as "broad citizen
opposition to the industry proposal", the Amateur Community will
generally have to be its own best advocate. We know the value of
the 2 Meter band during times of stress and emergency, the general
public is sometimes quick to forget the acts of service.

The poster also states that your "simple statement" will:

".....be included in the public record and will help to drive
home the point that there is broad-based approval to well conceived
2 Meter sharing proposals."

He appears to be asking you the amateur community to use the same
"simple statement" to support the view favored by industry. Somehow
the logic escapes me - when has the Amateur not lost out in the end
to every "well conceived sharing proposal"?

The poster then wraps up with the following:

"It ought to be clear to the FCC the public good is poorly served
by allowing hams exclusive use of these valuable frequencies."

Pay close attention to that phrase "valuable frequencies"! Obviously
they are of financial value to someone or industry would never have
come up with this proposal. This is $$$$$ speaking - NOT service to
the community, not public relations, and certainly not the voice of
a broad based citizenry.

Anyone wishing to register SUPPORT for the ARRL/AMSAT submission
should send a brief e-mail message to wrc97@fcc.gov. The Subject line
should say "Reference No. ISP-96-005 IWG-2A." A simple statement to
this
effect:

"I fully support the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal." This might be followed by a BRIEF example of a situation wherein the Amateur Service and the Two Meter band was of value to the community in times of stress/emergency.

As noted by the posting, your view -- supporting OR dissenting -- will be included in the public record and will help to demonstrate that there is support for your side of the question. Please do your own research, and don't get caught up in the rush towards "broad-based approval" of either side!

You know the value of the Two Meter Band and you know there are other groups who would like to market a few more Garage Door Openers or some other commercial (read $$$$$ making) devices. Once the frequencies
are gone, there may not be any others to share.

Comments must arrive at the FCC prior to 04 MAR 97

Please note, I apologize for the length of this posting. I was concerned
that the language in the original note ("oppose" the "opposition") might
be construed in the wrong way and do a dis-service to the Amateur Service.

73 Dave K7HMP
==========

From: AL7OQ <mfeldmn@ibm.net>
Message-ID: <3308ED3D.49D6@ibm.net>
Source record: 204404

I recently added a mid 80's vintage NCG 7/21/50 to my shack, after an extended search. For those of you not familiar with this rig, it's a 40,15.and 6 meter SSB/CW tribander, 10 watts output, with a built-in power supply, about the size of a standard smaller HF rig (TS-450, for example.) The rig was imported by NCG in California (the same folks who import Comet antennas) and manufactured by Matsushita of Japan (Panasonic, National Radio, etc...) It's pretty much a bare bones rig, but has a fantastic receiver, and excellent transmit and receive audio. I also own an NCG 15M 15 meter monoband mobile rig, have had it for quite some time, and fine it equally good.
(I also had the NCG 15SB, an older version, which was not a very good radio.)

My point: I would like to get in contact with other NCG owners. The rigs are fairly rare. Are there any mods or improvements available? Is there any useful info we can exchange? I'd also like comments on the NCG 10/160 and the prior version of the tribander.

Wrong here. If the League alerts its members to a threat to the amateur band allocations, and the membership (and Amateur community at large) agrees, it is by no means a "false" demonstration. It demonstrates that there is, in fact, STRONG, BROAD opposition to the sharing of these band segments with other sevices, as NO method of sharing has been proposed that would not severely interefere with existing services here, especially to the amateur satellite service. I encourage all those amateurs (who have not already done so) to file their comments OPPOSING the sharing of these band segments with other services.

Thanks.

The "false" comes into the picture when the league acts "concerned".
Fact is we have lost, and will loose spectrum, since the idiots in
Newington have promoted this as a "hobby" and dropped the "service". Add
incentive licensing, contests and NTS and you have a good case to get
rid of the whole lot of 500,000! ARRL did not get concerned about
220-222, now the whole band plus 2m and 440? The ARRL stacks the deck,
no doubt, but it (ham radio) is over. I am 34 and have been in radio 24
years. I said 15 years ago, hams were becoming "bookmarks" for
commercial interest. I was right. I work in the communications business
and read industry periodicals. Just wait till you find out we will also
be loosing space on 40/75 meters! This is coming real soon.
Burt, I do not know how you could put "which president do you trust
more?"
on your page. This piece of crap, in lieu of a leader, sells everything
to highest bidder. That is why you support the idea of "sharing" and
"getting along" since Clinton has made it so. For those who read this:
RCR a commercial trade newspaper has reported the Clinton regime plans
to make $50 BILLION off of additional spectrum auctions the next 2

years. They also admit that wireless company officials went to "coffees" at the white house. Now you ask why does Burt support all this? Because by Clinton selling our spectrum, he will get more federal money to use at work along with a raise for nothing! Computers, the internet in every classroom, more education spending..get it? More utopian spending at Burt's place of work.

I do agree 90% of hams are boring and unskilled, but to get to the point, sharing the 2m band will lead to exclusive allocation and then what do you do? I will become an outlaw: guns, scanners, ham radios, cigarettes, etc.

I will see you on 144.410 no matter who "owns" it!
Chris

: >religious wars are of no interest to me :-)
: >--
: >73 Joe VO1NA

: I've done such surveys, Joe. Recently I tuned across 20m on a non-contest
: weekday and did a count. I found a breakdown of about 41% SSB, 31% OOK
: Morse, and 28% digital and SSTV. There certainly were more SSB stations
: than my count indicates. I didn't listen long enough to get an accurate
: count of some of the roundtables, and the county hunter's net had a swarm
: I didn't even attempt to count. But the breakdown is fairly representative
: of one on one activity.

: I assumed, unless I had an indication otherwise, that each station I
: heard was in conversation with only one other, so I just multiplied
: the number of stations heard in each category by two. I didn't note
: any OOK Morse roundtables, and of course the PACTOR, AMTOR, GTOR, and
: Clover stations were operating one on one. Some of the RTTY stations
: may have been in roundtable, but I didn't print an indication of that.

: Separating out the swarm on packet was difficult, and I may have missed
: some of them (I don't have SOTA HF packet equipment since I consider HF
: packet, as we do it, a lost cause. I just pressed my old MFJ1274 into
: service to sort out the packet stations). I only heard one SSTV QSO going
: on during my sweep. I lumped that in with digital since it is a non-voice
: machine mode. I counted 125 stations on the band (and multiplied that by
: 2 to represent two way activity).

: I should note that this was done during a weekday, in daytime, and
: is thus heavily biased by retirees. That may account for the relatively
: large showing by OOK Morse. I did note that many of the Morse station

: calls copied were of the format expected of pre-68 amateurs, IE 1x3
: W and K calls. (I didn't copy everyone's calls, some were too fast for
: me to copy by ear, and some were sent too raggedly for machine copy,
: but I did count anything I could recognize as a OOK signal whether I
: could decode it or not.)

: I scanned 75/80m that evening. SSB stations were much more dominant
: then, 75m was packed with them. About 75% of the stations heard were
: SSB, 15% digital of one sort or another, and about 10% OOK Morse.
That seems unusually low although there is a lot of SSB on that band.

: There were large stretches of 80m where only noise was heard. That
: was in stark contrast to 75m where the signals were "wall to wall
: and treetop tall", and mostly in roundtables. I did make an effort
: to count the stations in the roundtables accurately this time. None
: of the OOK Morse contacts appeared to be roundtables, though I did
: catch one NTS traffic net on OOK Morse. It appeared to have few
: participants (6), not the swarm I remember from my days as a NTS
: OOK Morse traffic handler. (This isn't a surprise to me, most traffic
: has moved to digital modes today.)

: I started to scan 40m, but it was quickly clear that the dominant
: mode there was AM SW broadcast, so I abandoned the count and moved

There is no SW BC on the bottom 100 kc of 40. My experinence has been that
CW is quite dominant on this band as it is a popular DX band during sunspot
minima. I can't recall ever hearing no cw there (except during major
geomagnetic storms when all HD was dead)

:i on to 30m. This is clearly the digital band. 70% of the signals copied

Were these copied by a machine or heard by ear?

: were digital, with the remainder OOK Morse. The higher bands weren't
: open, and I don't have a decent antenna up for 160m at the moment,
: so that concluded my band survey for the day.

: The dominant digital mode was PACTOR, with the packet swarm taking second.
: RTTY was next, followed by Clover and trailed by GTOR. I only heard one
: AMTOR signal on any of the bands. That doesn't surprise me, it is
: fading fast as an amateur mode. And I didn't hear any PACTOR II signals
: during this sweep, though I have heard them on other days, especially
: when propagation to Europe is good. I don't have PACTOR II equipment,
: so I'm limited to identifying those signals by ear, and I likely missed
: some. I know I would have missed several of the Clover and PACTOR signals
: if I hadn't had good DSP receiving equipment for those modes. I did use
: the tuning indicator of that equipment to spot OOK signals, and I'd have
: missed several of them without its aid too.

: It is pretty obvious to me that OOK Morse usage is slipping, and that
: digital has continued to grow since the ARRL survey. It is unsurprising

You mentioned some digital modes were declining in use (packet and amtor for example.) Could you tell me which digital modes are popular now and if you expect them to remain popular for a long time?

In the 20+ years that I've been on the air, I can find no evidence that CW usage has declined. Although I don't have any data from previous years, I get the feeling that the traditional 'CW sub-bands' are much more crowded than they were 20 years ago.

: that SSB is the dominant mode on bands where it is allowed, but I was
: slightly surprised that it showed no greater lead than it did on 20m.
: Apparently that's a result of retiree bias due to the fact that I sampled
: on a workday (and due to the growing use of digital methods, even among
: the older set).

This 'retiree bias' thing may warrant further investigation.

: The dominance of SSB on 75m at night was more in line with my expectations.
: (I was gratified to see digital outstrip OOK Morse on 80m at night. That's a
: particularly challenging band for digital due to the extreme multipath. That
: people are able to cope with that is a strong testament to the improvement
: in the average digital station, and the adoption of more robust modes, over
: the last few years.) Clover was very close on the heels of PACTOR on 80m.
: I only heard one RTTY signal on 80m, and it was difficult print. I got the
: impression, I missed the brag tape, that the RTTY operation was actually
: using a mechanical teleprinter and a for real current loop driven homebrew
: FSK transmitter (it had clicks on shift, indicating hard relay keying of
: the shift capacitor).

Thanks for your imformative post, Gary. My observations (informal, but quite numerous) suggest a 50/40/10% split amongst SSB/CW/other, where other includes digital, rtty, sstv, etc.

The SBL-1 is a level 7 mixer. The dash numbers typically indicate
that the mixer was specially qualified over a certain frequency
range for a particular customer. According to the Mini-Circuits
Designer's Handbook, -10 is not a stock item, but there are other
dash numbers, and they all denote special qualification over portions
of the SBL-1 frequency range, so I think it is safe to assume that
is the case here too.

Don't worry about them. I have done it and I'd do it again. It's not so
much the radio being "type accepted" but rather a matter of money.
People that produce marine radios want you to spend your money on their
junk rather than have some smartassed ham radio operator mod their
own radio to work in that portion of the band they make radios for.

:)

>with character synch.

Well, it also depends on the nature of the channel errors. If the
primary error source is similar to impulse noise with a pulse width
much less than one dot time, you have a point. But if you're facing
a gaussian noise distribution, the shorter characters suffer more
because you'll recover less energy to contrast against the noise.
And if the channel impairment is multipath fading on the order of
22 mS (common), you have yet another situation, and you can lose
whole short characters to the fade. And you might not even know
you'd lost it because letter space duration is often ill defined
in manual Morse.

>- 7 dB.

Exactly right. I was reading a review of one of the new DSP filter
boxes last night and the reviewer was complaining that he couldn't
use the narrowest settings with a noisy signal because "the code
blurred together". That's because he was cutting off the harmonics

responsible for the element timing edges and the edges were blurring into the gaussian noise. He had to go to a setting 5x greater than the basic baud would indicate to get good copy, and that reduces SNR by -6.99 db.

With a uniform code and a known clock phase (either recovered or externally referenced) a machine could sample the center of the bit interval and not need to use a filter of 5x the basic baud, and thus wouldn't give away that -6.99 db. But even a machine can't do that with manual Morse. You have to locate those edges, and that costs you nearly 7 db in achievable SNR.

> The unit is in working condition but i have few problems with it:
> 1. Power suplay: is it possible to operate this handy from 12-13 volt ?

Yes the radio will work at 12v but NO MORE than 12.5....if you have a
13.8 V DC Power Supply, put two diodes (silicon & 2 amp or more) in
series with the POSITIVE lead (remember to check polarity!). That will
drop the voltage down to 12.4 which is safe...ran a 208 like that for
years! It may get hot if used for LONG TX times so if you dont like that
level, drop another diode in series...(each diode drops the voltage .7 V)

> 2. Programming the RPT channels, how do you do that ?

I take it you mean the MEMORY channels? Merely key in the freq on the
dial, press dial. The decimal dot will appear in the display...now press
the memory channel you want to put it in (0 thru 9) and press M for
Memory...that puts the freq in the memory...to access it, press MR and
then the number of the memory...

> 3. Back cover missing, does anybody has one to spare ?
> 4. Weak battery, the original battery seems to be weak and can't be charged. does anybody
know where to buy one ?

Back cover can be bought from Yaesu still....contact them at their
factory or here in the US at their California location (via the web).
The FNB4 battery is a common battery and can be found from a lot of
battery makers...cost is about $24 US on the average. I wouldnt pay more!

> 5. Operator/Workshop manual, if you have one please e-mail me.

Again, Yaesu may be able to help....contact them if you cannot find one
on the web OR if you have FIDONET access, check in on the HAM-TECH echo..
someone there may have it..

Mike,

I seem to recall the replacement fuel pump I put in my S-10
Blazer had a ceramic cap in parallel with the motor leads.
I think it was behind that filter 'sock' that slips over the
pump assembly. I was more irritated after having the vehicle
towed 100 miles on a Saturday nite in 90+ degree wx to really
get wound up over the capacitor!

I havbe an old Weather Band/FM/TV audio receiver that i bought at a garage sale for $2 that i would like to downtune to listen to either the 2m or 6m band. I'm pretty sure this is possible sine the Weather Band is 166.55 MHZ, and Channel 2 audio is only slightly above the 6m band. I was playing around with the tuning capacitors and did manage to get the radio to receive the aircraft band. Please Email, me if you can help, since I'm living on a students budget and *REALLY* would like to get into amateur radio. Thanks.

Hello everbody...Well about 3 years ago, I got my "Basic Amateur Cetificate" here in Canada which allows me to work all bands above 30Mhz. Well being on a students budget doesn't give me much leeway in terms of equipment. I'd like to get on the air (preferably on the 6 or 2 meter bands) with as little expense as possible. IF somebody has a schematic for a transmitter in these bands I'd like it very much if you Emailed it to me (doesn't have to be powerfull, just a watt or two). And any other suggestions on receivers or transmitters on the cheap would be much appreiciated.

>I've *never once* heard Drew speak of the 99.9% of operators who are the
>true ladies and gentlemen of our hobby/service, abiding by all regulations
>in their day-to-day QSOs.

I agree that Drew is focusing on a small segment of the amateur
population by spotlighting a particular group operating on a
particular frequency. But I doubt you could legitimately claim
that 99.9% of all HF operators abide by all the regulations. I'd
even suggest that fewer than 99.9% even *know* all the regulations.
In my day to day operating, I hear rules violations all the time.
Most are either minor or unintentional, of course, but plenty of
them are gross and intentional.

You're painting with too broad a brush to claim that 99.9% of
amateurs are true ladies and gentlemen who abide by all the
regulations. In particular, on 75m the percentage who always
operate legally, or in a gentlemanly manner, appears to be much
lower than 99.9%. At times I believe it falls well below 50%.
In fact, at times, the behavior on CB looks downright respectable
compared to some of the antics we hear on 75m (partially because
75m propagation currently exposes us to a larger number of
operators than we receive on CB of course).

Now 75m has the most obvious problem children, but they are other
places on HF too. In particular, the number who like to swish
carriers or send strings of dots over digital QSOs have grown
immensely in recent years. (Of course those folks *are* ignorant,
or just plain stupid, if they think they can disturb a machine.
It has infinite patience and just keeps trying until the message

is passed.)

We have a problem with these folks, and it is not with a small enough number that we can just ignore them. At a casual glance, one is tempted to stereotype these folks as "poor white trash" whose momma never taught them how to behave in public. But a closer look shows that not to generally be the case. As on CB, many of these folks are putting on a pseudo-redneck act. Nor are many of them punks. Most are amateurs of long standing. Many are well educated and relatively well to do. They use the radio as a way to vent their sickness, a sickness they have to keep bottled up in their face to face day to day dealings, but which they feel free to vent on the radio (and for many, on internet newsgroups too).

The behavior we see on this newsgroup is to a large extent similar to what we're now seeing on the air, especially on 75m, since the FCC abandoned enforcement. I think it is safe to say that fewer than 99.9% of the participants here behave as true ladies and gentlemen either. This group often fills with hate group behavior (witness the current and past Lambda threads, and the posts of a large proportion of the Code Warriors), and has its share of fringe loonies, and its share of trolls looking for a fight. It is now no different on the air.

Paradoxically, such foul behavior is much more rare on VHF/UHF. Perhaps that is because amateurs operating there are much more likely to come face to face with each other from time to time. But there are isolated problems even on VHF (mostly dorks who use their illegally modified radios to crosslink amateur repeaters to public safety systems). But we have T-hunt teams, and cooperative local police, to quickly deal with that sort. We don't have that sort of enforcement on HF.

Maybe so but I for a fact of a guy on 75 meters that could dial into 8 others HF radios via the internet and at the same time be talking from 8 different locations throughout the southeast United States and if you were there you couldn't help but hear him.

3806. Why I changed my mind on the code...

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-17 00:00:00 UTC
From: arden@teleport.com
Message-ID: <3308814b.1516096@news.teleport.com>
Source record: 204439

I've always been a supporter of the No-code license. I thought that young people simply wouldn't put up with wasting time on an outmoded technology. I've even posted messages to this newsgroup to that effect. I've gone out of my way to befriend new no-code hams. But now I think I was wrong--at least partly.

Yesterday I was scanning on two meters and overheard a conversation between two "hams" with new callsigns. One of them said, "I got it just so I could communicate with my friend while wind-surfing. I can't believe all these old farts who want to talk about radio and electronics all the time. They're always trying to talk me into learning code. I wish they'd get a clue and shut up--like I'd really be interested in all that radio s**t. BORING!" His friend came back and said, "Yeah, I know what you mean. Even when they aren't talking about radio they as interesting as watching grass grow. They should get off their butts and do something fun." They first guy responded, "But, God, this is sure cheaper than cellular. That test was so easy. What a joke. If they're going to give out the answers in advance they should get a clue and just drop the test. Like it's going to keep anybody out."

I realize that there are many no-coders who want to upgrade and can be regarded as good hams. I realize that this was just one conversation out of many. However, the idea that a conversation such as the one above could even _exist_ on the ham bands makes me a little sick. How do we reap the benefits of the codeless license without allowing abusers of the system as described above into our fraternity (not to mention the societal benefit of improving the radio art)?

Here's a couple of ideas:

1) Keep the code free license but make it a two-year non-renewable one. At the end of two years you must have upgraded to general or forfeit the license forever.

or

2) Increase the difficulty of the tech test by a factor of about five. No more question pools. I passed the tech test (which then was the same as the general test) without "question pools" when I was thirteen. It was a real challenge but it won't keep out motivated people--even kids.

Now I realize that it might be the case that this will limit the influx of new hams and ultimately kill ham radio. For me though, it's a question of which way to go. We could have a ham radio service that

lives in name only filled with people escaping the "high price of
cellular." As far as I'm concerned, this is the equivalent of
death--an ignoble death through intellectual starvation. Or on the
other hand, we could go out with some honor intact in a hundred years
or so.

Reasoned opinions to the contrary welcomed,

> get off their butts and do something fun."

Perhaps if we (collectively) were better at conveying how interesting
radio
is and if we (collectively) stopped trying to twist their arms to learn the
code,
they would stop turning off before they have a chance to find the
interesting
parts.

The point is that it's clear that the young guys above perceive that ham
radio's essence is "a bunch of old farts who constantly try to talk them
into
learning code" ... that's what they see as "BORING!" ... their perception
of ham radio is *totally* driven by the old farts and the demand for Morse
code, not by any knowledge of the exciting things that *can* be done with
and through the use of ham radio ...

Now, perhaps, the two quoted above are just a couple of "surfer dudes" who
will never have any interest in anything but waves, babes, and beer ... but
the vast majority of would-be hams are NOT like that ... but they are still
turned
off by the hordes of "olde fartz who insist on cramming code doewn their
throats
and spend most of their time belly-aching about their prostate problems."

It's long past the time when we (collectively) should stop bitching and
whining about, and looking for ways to degrade, the would-be hams of
this world. We (collectively) need to recognize that the sorts of behavior
described above, coupled with technical stagnation of the masses, are
the main problems and the main reasons why our service is aging and dying.

> I realize that there are many no-coders who want to upgrade and can be
> regarded as good hams. I realize that this was just one conversation
> out of many. However, the idea that a conversation such as the one

The thing that should make you sick is the fact that hamdom has degraded
to the point where people feel that way about ham radio in general.

Make it relevant and meaningful, yes ... eliminate the wrote memorization
of answers and structure the test in a way that requires the applicant to
demonstrate true understanding of the principles and material being tested
by ramdomizing the input values where calculations are required, requiring
demonstrations of schmatic reading, etc.

But the goal should not be to make it so hard that it keeps out huge
numbers
of people ... just hard enough to make sure they know what they should
know.

>
> Now I realize that it might be the case that this will limit the

I don't believe that more meaningful theory exams will present a real
barrier or dissincentive to *most* would-be hams ... the code test is
far more counter-productive and a much bigger turn-off to most.

There's no way that the current, code-centric, chase DX and contest till you
drop, do-nothing of value to society majority mindset will be permitted to
retain and control billions of dollars worth of spectrum for anything approaching
a hundred years.

Ham radio has to undergo drastic modernization and mindset alterations VERY FAST, or it will cease to exist within 20 years or less, IMHO.

3811. FS: 37' Telescoping Mast - $30 <San Jose, CA>

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-17 00:00:00 UTC
From: gvs@netcom.com
Message-ID: <330e883f.50995775@192.0.2.3>

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.misc

<<< Sale in San Jose, CA. >>>

Had to take antenna down because of landlord.

37 foot Telescoping Mast originally designed to support a 10-80 meter inverted-V, but could be used to support a small rotor and beam (28mhz up to vhf/uhf).

Material used is schedule 80 PVC Tubing, in 4 sections, with O.D's: 3.50", 2.75", 2.25", and 1.75". The sections are held in place by a u-clamp and thru center eye-bolt arrangement. Each u-clamp has 2 outer eye-bolts, along with the thru center eye-bolt, which are used as guy points.

The bottom 3 sections use PVC sched 80 reduction union joints (very beefy) which I reamed out to allow upper sections to slide thru freely. The three over-lapping sections are over lapped by 12, 16, and 18 inches, from smallest to largest dia., respectively. Each upper section has 2 sets of 3 spacer bearings that take up the excess play inside each over-lapping section.

As you may well have gathered, I have an Engineering background and took some time designing this Telescoping Mast. It wasn't something I just threw together.

The last 2 years in San Jose, CA, has brought storms with winds as high as 75 mph. This Mast barely moved during these storms. Also, I use three sets of guys which are marine-type nylon rope that is UV resistant.

Mast is more durable and can withstand higher wind speeds than a steel mast, when guyed properly. Also, Mast doesn't interact with antenna like a steel mast would.

SB QST @ ARL $ARLB008
ARLB008 Comments needed, Little LEO

ZCZC AG08
QST de W1AW
ARRL Bulletin 8 ARLB008
>From ARRL Headquarters
Newington CT February 14, 1997
To all radio amateurs

SB QST ARL ARLB008
ARLB008 Comments needed, Little LEO

Commercial satellite interests seeking access to bands below 1 GHz--including amateur allocations at 146 and 430 MHz--now have added 220 MHz to their ''wish list.'' For the first time, Little LEO (low-earth-orbiting satellite) interests have proposed including 219-225 MHz in their list of desired allocations for the non-voice, non-geostationary (NVNG) mobile-satellite service (MSS). The move was contained in the industry's so-called ''flexible allocation proposal,'' delivered at the February 13, 1997, meeting of FCC Informal Working Group (IWG) 2A. Little LEO targets now include 146 to 148, 219 to 225 and 430 to 450 MHz. The ARRL and AMSAT were among those objecting to the concept, and the League is urging those who agree with their position to comment to the FCC by March 4. IWG-2A has been preparing draft proposals for the 1997 World Radiocommunication Conference (WRC-97). These will be reviewed during a March 5 meeting of the FCC's WRC-97 Industry Advisory Committee that is preparing draft proposals for consideration by the United States as it gets ready for WRC-97

The ARRL and AMSAT statement said the latest proposal affecting amateur allocations in the 219 to 225 MHz segment came ''at the last possible moment'' and ''without any technical support whatsoever.'' The League and AMSAT pointed out that the little LEO proponents have had more than a year to complete a technical study of the possibilities of sharing with the amateur services in the 144 to 148 MHz and 420 to 450 MHz bands. ''They have not demonstrated compatibility for sharing these amateur bands but over the evolution of their document have proposed various 'new ideas' for use of these bands.''

The little LEO flexible allocation strategy for WRC-97--submitted as IWG-2A/86 (Rev. 6)--is to propose broad allocations. The apparent theory is that most administrations would find reasons to oppose little LEO use of specific bands in the crowded spectrum below 1 GHz, but that a broad allocation would permit different implementations in different countries

depending on local circumstances.

At the February 13 meeting, a coalition of spectrum interests--including land mobile, amateur, broadcasting, and military--opposed the flexible allocation concept on three grounds: that the concept is simply an invention to avoid performing technical sharing studies that would demonstrate the unfeasibility of sharing; that it is inconsistent with decades of ITU allocations practices; and that, if adopted, the concept would be counter to US interests. The coalition document is identified as IWG-2A/107.

The ARRL and AMSAT submitted a further statement of opposition, citing the absence of any technical studies that might support sharing with the amateur service or the amateur-satellite service and pointing out that the little LEOs have completely mischaracterized the nature of ITU Resolution 640 regarding the use of certain amateur bands in the event of natural disasters. The ARRL/AMSAT paper, revised to reflect opposition to the late proposal to include 219-225 MHz, is identified as IWG-2A/108 (Rev. 1).

Amateurs also might find interesting the comments of the Department of Defense, identified as IWG-2A/101 (Rev. 1). These address the 430 to 450 MHz segment the Little LEOs seek to share.

Anyone wishing to register support for the ARRL/AMSAT submission should send a brief e-mail message to wrc97fcc.gov. The Subject line should say ''Reference No. ISP-96-005 IWG-2A.'' A simple statement to this effect, ''I support the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal,'' will be included in the public record and will help to drive home the point that there is broad-based opposition to poorly conceived sharing proposals.

Please note. The proposals the League opposes are not FCC proposals, nor are they endorsed by any other branch of the government. They are industry proposals. The League's objective is to demonstrate there is broad citizen opposition to the industry proposals, so the government will not adopt them as US proposals. So, please don't ''flame'' the FCC if you comment.

Additional arguments or evidence also is welcome. Important. Comments should reach the FCC no later than March 4, 1997.

The complete ARRL/AMSAT opposition statement and other comments will be posted by February 15 on the ARRLWeb page, h
ttp://www.arrl.org/ under Band Threat News.

No, there's no such permission, it's actually worded as a negative.
S97.403 says that nothing elsewhere in Part 97 prevents a license
holder from any activity to save life or property which are under
immediate threat.

You may see that as an unimportant difference, but I think it is very
significant. What it means is that you have no permission or
imunity to rely on if and when the FCC or some other branch of the
Federal, State or Local government charge you with a violation of
some other statute, only from penalties for violating CFR 47 Part 97
itself.

WHY do you ONLY want to give away 2 meters, Burtie?

Why not get all the hams to write the FCC and recommend that they give away ALL of our spectrum?

I am sure the readers of this newsgroup are already dashing off letters by the DOZEN to the FCC in response to your great message, since we all follow you like the pied piper!

Burt Fisher <burtfisher@geocities.com> whistled a happy tune like:

Try contacting a cooperative GM Service Department at a dealership in
your area...no, you have to find someone who wants to "work with you."
GM publishes numerous bulletins on reducing noise in third party radio
systems when installed in their vehicles. These are available through
dealers, or there is a GM office that will mail/fax these out as
requested. I know this service exists because my brother had gotten
bulletins from GM in the past.

I'm a professional educator of electronics and computer service technology. I've only had my ham ticket for about a month now, but I'm learning a lot about this fascinating field. In fact, it was a few of my students that got my interest up in ham radio, and I've done what I can to promote it to my other students. I view it as a national resource... and also realize that it is fast becoming an endangered resource!

Reading these newsgroups has helped me have a better understanding of not only the technical aspects of the field, but the kind of people that are involved in it. The vast majority of the participants in these groups are extremely helpful, and willing to do anything they can to promote amateur radio... proud followers of The Amateur Code by W9EEA!

I've also learned that there are a small number of participants that prefer to use the newsgroups for their own pleasure... attempting to degrade the service and those participating in it. No doubt these types have other interesting diversions when their computers and rigs are down, such poking sticks into hornet nests to observe the reaction. I've been around long enough to know that this type of person will continue to provoke a response until they are ignored long enough. Even

the hornets learn this lesson!

Perhaps the formation of a new newsgroup, such as rec.radio.amateur.whiners-cryers is in order, so that these types can have their own little playground and stop spamming the groups that are helpful!

Also... please don't think anyone identifying himself as a "teacher" speaks for everyone in that profession. Hopefully you too have been around long enough to realize that there will always be a few dog-eared cards in the deck. Fortunately, they are easy enough to identify.

Obviously, I'm opening a path for flames by posting my opinion here... and from the childish battles I've read on these newsgroups, I certainly expect a few. I'll just ignore them. Then the flamethrowers will find another nest to poke.

My two cents...

John - N3YPR

Carl R. Stevenson (carl@ais.net) wrote:

: Perhaps if we (collectively) were better at conveying how interesting
: *radio*
: is and if we (collectively) stopped trying to twist their arms to learn the
: code,
: they would stop turning off before they have a chance to find the
: interesting
: parts.

First point: Right on the money. Instead of denigrating the no-coders, how many older hams are actively elmering the newcomers, as we were elmered when we were new?

Second point: Well, for the time being, the code tests are a reality that has to be faced by anyone upgrading, if only to Tech Plus. The time is coming soon that we will all be able to voice our input on the code, but we have to deal with today, not an uncertain future. Chances are better than average that if ARRL gets behind retaining the code, it's going to stay, like it or not.

: Bad idea ...

Why is this a bad idea? Should everyone remain at the entry level forever? How is the purpose of Incentive Licensing served?

Sometimes, we all need an incentive (or disincentive, in this case) to move on. I need to keep in mind that I need to pass my 20 wpm. by September, or retake the Extra theory exam. Used to be, Novices had to upgrade in one or two years, or go off the air. I'm sorry to see that they abandoned that requirement.

I'd agree that there are those who got into ham radio for the wrong reasons. This bit of avoiding cell phone charges is a particular peeve with me. Same goes for XYLs who got licensed only to stay in touch with the OM.

This is my final comment on this subject, so JeffreyH, Busybody,the fellow who openly admits the he "will never mind his own business" will probably end up having the last work.

Many local hams have seen my radio shop and can verify all of my claims to its existence. As for the modifications, I didn't "suggest" that anyone do them, nor did I tell anyone how to (I'll leave that up to the many, many users of the popular Artsci publications I was referring to); In response to a previous post, I merely stated that the modification could be done with success.

As to your other gratuitous comments, get a life Jeffrey! No-one wants to listen to you pontificate out here. Maybe you should get a job for the federal government- there, you can spend as much time as you want in pious oversight of the moral fiber of the rest of us (or perhaps you've thought of that already...)

A-Yup, this one needs to go away. A (simple?) multi frequency,
digital code device can be built yourself if your so inclined to. Why
pay much more for something you only need if your into illegal doings.

Jerry

Don't laugh, I'm serious... But try a little peanut butter on it. Creamy
is better because because it has no nuts. I REALLY WORKS.

(It must be the peanut oil or something, I dunno. I always tell this
to people and they look at me funny and say something like, "Good one."
Then they realize I'm not joking and try it. So TRY IT!)

Not necessarily ... what we really need to do is organize an alternative
national organization with progressive goals to challenge the ARRL's
stranglehold on the FCC/regulatory process ...

> requirement.

All of the emphais on code speed as "advancement" or "upgrading" is the problem .. being able to copy faster Morse doesn't in the view of many constitute " advancement ...

"incentive licensing" was/has been THE most devisive thing to happen in ham radio's history ... it's another invention of the ARRL, desgined to foster faster code
as THE criteria for "advancement" in ham radio ...

as Gary has pointed out, the license is an entry permit, not a graduation certificate.
Too many hams figure "got my ticket, no need to learn any more" rather than "got
my ticket, now I can really get into learning and experimenting with things."
The ticket is not a trophy to be valued for the effort (torture) that went into getting it
but, rather, as a permit that allows one to do something useful/valuable.

In article <3308814b.1516096@news.teleport.com>,
arden@teleport.com (Arden Eby) wrote:
[
[I've always been a supporter of the No-code license. I thought that
[young people simply wouldn't put up with wasting time on an outmoded
[technology.

[I realize that there are many no-coders who want to upgrade and can be
[regarded as good hams. I realize that this was just one conversation
[out of many. However, the idea that a conversation such as the one
[above could even _exist_ on the ham bands makes me a little sick.

Would you have preferred that those two guys not been hams? That
they not have spent a few hundred dollars on ham gear to keep Icom
and HRO in business?

WE NEED NEW HAMS.

You are getting a little lost -- the messenger MUST NOT be the
message -- if all we have to talk about is the equipment we bought to
talk about it, WHY BOTHER? That conversation makes ME a little sick
too -- here are a couple of guys who are probably about 20 years of
age, and all they hear on the bands is guys bragging about their
toys! This is why I have all but dropped hobby-hamming after 16
years . . .I do public-service and disaster work, but that's it,
because there are no other real activities in the ham community
around here.

[How
[do we reap the benefits of the codeless license without allowing
[abusers of the system as described above into our fraternity (not to
[mention the societal benefit of improving the radio art)?

You have the oder reversed -- get them in, then CHALLENGE them to
find activities that they enjoy.

[Now I realize that it might be the case that this will limit the
[influx of new hams and ultimately kill ham radio. For me though, it's
[a question of which way to go. We could have a ham radio service that
[lives in name only filled with people escaping the "high price of
[cellular." As far as I'm concerned, this is the equivalent of
[death--an ignoble death through intellectual starvation. Or on the
[other hand, we could go out with some honor intact in a hundred years
[or so.

"Pull up the ladder, I got MINE" is hardly the attitude we should
take. And it won't be 100 years, it won't even be 20!

And what honor is there in letting this happen at all?

I think you need to reconsider your mindset. You see two guys griping, but _I_ see two guys who have made the effort to get a ham license, who are using their licenses, who are developing the skills that someone like me amy need them to use following a disaster.

And these guys are more likely to be in the shape needed for DR communicators than most hams. When I give a course on Emergency Response to the Scouts, I tell them that "I'd rather see a deacon on a dirt bike than a Bishop in a Buick." We need to keep in mind that a windsurfer with an HT is worth more than an old fart who would forget that there's a 12V jack on his rig except for spending his day on 20M bragging about the features of his radio.

3832. Help: Drake TR-4 main tuning control

I have a Drake TR-4 whose main tuning control is jammed (won't turn).
The unit has plastic gears in the tuning mechanism. Does anyone know
if these need to be replaced or what else may be causing the problem?
Unless there is a suble wearing of these gears, there doesn't appear
to be anything preventing the tuning control from turning.

3835. Westec alarm 7Mhz interference

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-17 00:00:00 UTC
From: Dana Roode <DRoode@uci.edu>
Message-ID: <3308A7A2.567A@uci.edu>
Source record: 204468

A neighbor of mine (about a block away) has a Westec alarm system that is picking up my 7mhz (and 3.5mhz) signals. I'm a CW operator - when I key down the interference sounds like corn popping - clicks in the alarm speaker. The clicks do not coincide with the dits and dahs of the code Im sending. It seems there is something charging and discharging throughout the period the RF signal is present.

I've attempted to install ferrite split-cores around the cables coming into the affected control panel, without much success. From this experience, and from the fact the LED display in the control box dims as I transmit, it appears the signal is coming into the main alarm power supply, and affecting the control boxes via DC.

I'm hesitant to open the power supply box without more information from Westec. When we called them, they are willing to come out and take a look at mucho-$ per hour, but didn't offer any guarantees they could fix it. It seems like something their average-tech may be il-prepared to work on, but I could be wrong.

Does anyone out there have similar experience or have a contact with Westec? Any advice or information would be appreciated, please e-mail me directly to:

DRoode@UCI.EDU

Thanks much,

Dana Roode, K6NR

With Pork Butt attending the Orlando HamCation this weekend, things were unusually quiet on "THE ZOO" both Saturday and Sunday evenings. However, there was some eruption of combative activity earlier tonight. The topic of tonight's battle was "WHO'S JAMMING WHO?" Donnie was blaming Polly for Al's actions and behavior on the frequency. Polly then blamed Donnie for blaming Polly for jamming when Polly was not jamming because Polly was being jammed while someone else was doing the jamming and...well, you get the idea.

Usual high-level noise floor underneath the main "participants", consisting mostly of bodily function noises, mild profanities, and rock music.

And the hits just keep on coming...

You guys are missing the point. The question becomes, wither this hobby
is about the future of radio and electronic communication or about preserving
radio history and lore.

We all know the reason for too few HF upgrades, that is a tabo topic.

I will add some of my experinces, I am a field service rep and work on
electronicly controlled mechanical and networked devices. When I
mentioned that I had
goten my anateur radio lisence durring breakfast (they laughed a lot) I was
asked if I had "learned all that morse code stuff", I responded by saying
that it ws no longer required, the response that met with general agreement
among the other techs was when soneone said "it's about time, after all,
this is the computer age". Of 450+ techs my co has one ham, me.

I was checking into getting permission from Cal-Trans (the highway dept)
for our club for the puting up a highway sign posting the only local 2M
repeater Fr. I finally got to talk to the person who could make a decission
(a story in itself), and discovered that there was no way that we could
get permission. I was told that "with cellular telephones "(there was no
cell coverage of this area at that time) "and React" (I think that I spelled
React right)" amateur radio is an un un-necessary redundency "(remember,
all we had wanted to do was to put up a sign)(but then came the clencher

for him)" AND BESIDES, WE "(Cal-Trans) "DON'T WANT TO GET TIED DOWN IN ALL THAT MORSE CODE AND STUFF"(all we had wanted to do was to put up a sign).

The simple facts are that in tying itself to radio history and lore instead of the future, ham radio has been turned into a joke. I enjoy it, don't get me wrong there, it is a fun hobby, but like my muzzle loading rifles, a hobby is all it is.

From: jsjones@intrlink.com
Message-ID: <5e8oh3$bs9@krypto.zippo.com>
Source record: 204561

Would like to hear from owners from both of these HF amplifier companys. I have just ordered a Alpha 91B but have heard some negative feedback from owners what few I have talked to about the service. I know when I have called out to Alpha power I have ot always been real impressed with the organization or should I say lack of it and lack of friendliness. I know they are moving into a new building so maybe this accounts for the poor phone help. When I have called QRO the owner has always answered the phone and is always willing to answer any and all questions. They offer basically the same amp with the same tubes but with a two year less warranty. The QRO is also heavier in weight which the owner of QRO tells me is due to the fact that they use two transformers, one for the amplifier and one for the screen power supply. He also said they use a much heavier duty band switch. Even with the 4 year warranty from Alpha Power if the service is not good it is not worth the paper it is written on. So please I would love to hear from any and all past and present owners from these two amplifier companies and what you think including what kind of luck or lack of it you have had when you needed service. I would appreciate any and all replies so I will know wehter I need to cancel my 91B order and order a QRO HF2500DX which I would love to hear from some owners of this amp. 73, DE-KS4HK, Steve

OTOH, forgetting the character synch problem for a moment, if the
channel has a constant bit error rate, the shorter the character code,
the less likely it will be hit by the bit error. If the most common
characters have the shortest codes (roughly true for Morse _plain_
text English), the character error rate will be lower than with
uniform codes with the same BER. This of course ignores the problem
with character synch.

Some operators have a guite distinguised way of sending certain characters, such as Ls, Qs etc., so it might be possible to fine tune the decoder :-).

The problem with non-uniform timing with manual sent Morse is that you have to get each _transition_ of the keying waveform and this requires a quite high dV/dt in presense of noise to get a reasonable timing for each dot or dash. A hight dV/dt also means that you have to get the 3rd or even the 5th harmonic of the baseband signal, thus requiring a bandwidth 3 - 5 larger than what would otherwise be required for machine reception. The larger bandwidth OTOH, will reduce the SNR by 5 - 7 dB.

: So Jim, what do you do when the newcomers tell the "old fartz" to "F-off"?

Well, thus far, I haven't seen that strong of a response. However, I have found that it's more a case of "You can lead a horse to water, but you can't make it drink."

We have everything in place at the local club, to help the newcomers to advance. We have a clubhouse, two HF setups, classes in code and theory (I'm teaching an Advanced class right now, and plan to teach Extra and General, as well) and we want to get more involved in VHF and above weak-signal work, just to show what can be done within the scope of their existing licenses.

Except for a couple of guys still in high school, there has been little response to our offerings - and no one is trying to ram the code down anyone's throat - we just point out that we have all sorts of study aids and experienced hams to help them to upgrade. In my advanced class, everyone except my XYL is retired!

I don't know what else we can do.

: On this newsgroup alone I see a significant amount of intolerance for
: the older members of the hobby, as if they were some festering cancer that
: needs to be cut out. I have found, with a few exceptions, that most
: 'old-timers' are more than willing to help newer hams.

This is true, from where I stand, as far as being willing to help.

[interesting story snipped]

I'm not sure how much of the "haole" thing is racial. It could be that the islanders are sick of tourists, and I can't say that I blame them. We're considering retiring in Hawaii, but more like Hilo, or somewhere off the beaten path.

Back to your story, though...it could be that the newer hams are somewhat afraid to ask. And these condescending attitudes toward them *are* out there, but I don't notice it too much at the club.

Most of your responders have named goo-gone as a good label glue remover. Goo-gone works fine and is available almost anywhere. There is, however, an alternative that most kitchens have.

Lemon extract works on almost every glue and tar I have ever encountered. NOT lemon JUICE; lemon EXTRACT.

Non-toxic, smells good, leaves little if any residue. Any visible residue can be removed with glass cleaner.

We used it at a personal computer shop for years. Most early (and most modern) plastic cabinets on computers were made of the cheapest available plastic. Most cleaning agents marred the surface. After some research we found that lemon extract was an effective, inexpensive solution (pun intended).

I use lemon extract on anything where I am concerned about the appearance of the surface. BTW, it also removes solder resin, cigarette-smoke discolorations, etc. Combined with a small, firm-bristle brush it is very effective on rough surfaces.

Like someone said "It does not matter if it is legal or not, if a life is on the line..."

This is true, if anyone's life were on the line they would probably even use illegal drugs (such as marajuana) to save themselves. I think that what most people are trying to say here, is that for casual or replacement use, it is illegal to use a ham radio for out of band transmission (with the exception of MARS/CAP of course). These radios were not FCC TYPE ACCEPTED for that use, and consequently they were never tested for such use. For one to simply assume that if he clips a wire he can transmit anywhere that he is authorized to do so, is ignoring this regulation.

These radios have very "wide" receive front-ends, and fairly narrow (read: ham band only) transmitt bandpass filters. Attempting to transmitt out of the ham bands on these radios could generate spurs which will possibly interfere with other vital communications in the area. In theory, one might jepardize some other legitimate "life-threatening" situation by interfering with their legitimate communications efforts!

Think about this before you use your Kenwood or Yaesu handheld on the marine bands, or especially on police and fire frequencies. If you insist on taking the chance and saving a few bucks on equipment, at least take the radio to a qualified tech so that they can put it on a spectrum analyzer to make sure that it is transmitting a "clean" signal.

Just a thought. 73's, Steve.

I hope that I won't get hate mail for writing this, but I'd like to share an outsider's view on the no code license. First a little background on where I'm coming from . . .

About 28 years ago I had Mr. Cross for High School Electronics. Mr. Cross had a great love for Ham Radio and he wanted all his students to get their novice licenses. Every class we worked on code, electronics, and the rules we'd need to know. I found the electronics and rules to be the easy part, but for me, the code was the tough part. In the end, I came close to passing the code, but I didn't quite make it. Had Mr. Cross tauight electronics the next year, I'm sure I would have gotten my novice license, but someone else replaced Mr. Cross. :-(Still, I built a shortwave radio receiver from a kit and I loved to listen in.

Years passed and I never tried to get even a novice license. However, several months ago my friend Bill told me about how he decided to get his license. (In fact Bill now has his Advanced Class and is working to get his Extra Class.) After some thinking about it, I went down to the local Radio Shack Store and picked up a book on the No Code Licence. While I'm only part way in studying the book, it seems very clear to me that _starting_ with the "no code" Technician Class License is a logical first step. At a later point, I could focus on the code and could move to the Tech+ Class. etc. etc. . . .

I feel that the young guys who spoke about all that radio sh**, saw the old timers as old farts, and saw ham radio as a cheap cell phone; are the exception, not the rule. Those "Bozos" will soon loose interest in their new toy and move on. However, there are others, like me, who see the "no code" as a good starting point. Wasn't that the point of the "no code", to provide an easy starting point to attract others into ham radio?

3868. Something is wrong with our government!

I do. I've seen the result of anarchy in both small- and large-scale settings - devastation is the only word that can describe the final outcome.

If you believe certain regulations are disadvantageous, then try your hardest to get them changed. But to go breaking laws out of laziness or thriftiness is shameful.

|>when they come up on 10 meters with their 'freebanding' and interfer with
|>amateur communications. That's when I fire up the linear and call a lot
|>of CQ's.

Me too - and anyone who imagines that the atmosphere is supposedly "stuffy"
between 28.0 and 29.7 MHz is a looney!

There is a lot of excitement there, satellites, e-skip, CW, packet, SSB,
AM, FM, repeaters, 6m spotting nets etc. etc. etc. - it REALLY makes 26 and
27 MHz "Freebanding" seem VERY boring by comparison - maybe even "stuffy!!"
I seriously doubt his claim that there are "millions" of stations on there
freebanding anyway! With the death of the CB craze there are not many at
all. Take a look around. How many MOONRAKERS do you see any more?
Even CLOSER to home, look at the cars on the interstate!! Almost ZERO CB
antennas any more!

When the intrusions above 27 MHz start again though, you can bet I am ready
to call CQ right on top of them with all the power I can muster!

From: Douglas Gavilanes <gavilan1@earthlink.net>
Message-ID: <330A04E6.2881@earthlink.net>
Source record: 204243

Greetings. I am looking for information about the various iterations of the Ameco switching receiver preamp for HF transceivers. I am considering buying a used one, but don't know anything about them, other than the basic idea of preamplifying my receive, and switching out of line upon transmit. Can someone tell me what the differences are between the PT, PT1, PT2, and PT3 (current model)? I want this preamp for my TS-430s to be ready for 10M openings that seem to be hapening more frequently now. Any help appreciated.

Simple: He just refers them to the following newsgroup:
news://alt.radio.pirate
Just because this guy has NEVER been involved in SkyWarn, RACES, ARES, or built his own repeater network from the ground up, he thinks these things should be left to the broadcasters, and commercial guys only! He's obviously got the knowledge, and spent some time doing some technical things (he's an extra), but he must now be bored.

It is not impossible to do it... But it is not good engineering practice. Amateur Radio equipment is not type accepted for marine use for a reason; they are not as clean on the output as the type accepted ones are. But if the amateur equipment is used soley as backup to regular marine equipment that is no problem. The real problem is that alot of hams THINK they know electronics and RF theory, and in reality do not. that does not mean that one should not experiment - because it is experience that teaches best of all! So go ahead and experiment, but follow the rules, for they are there for a reason, your service monitors (if you have any) will verify it.

>Look carefully at Table 2: E receives 144-146 and 430-440, while E3
>receives 67-180 and 400-512 MHz.
Which is *exactly* my point: the receive ranges differ, yet the diode-matrix (D302-D308, labeled 'Destination diode' in table 2) is exactly the same. These diodes tell the unit how to behave. Now if the E and E3 units have the same diodes, how can they behave differently?

Note that I feel the documents contain a wealth of information,
I was just hoping to keep anybody from opening up his/her handheld and moving diodes, only to find out there is an error in this table 2. The TH79 is to precious for that.

> It appears there is no way to get the 800 MHz band on "K" (U.S./Canada)
> models, which should make Newt Gingrich happy.
Still, I see TH79A's advertised WITH 800 MHz in various newsgroups. As I understand it the older units can receive 800, but the newer ones can not. I somewhere read in an article that you can see this from the serial number:
===If your serial number is 603XXX or higher, that is all you will get. The
===TH-79A that I have posted is 602XXX
I cannot find the original article though- you'll have to search the net for it.
There may be a NOSPAM. in front of my E-mail address.
It is there to fool machines, not people.

3885. Artery Blockage & Heart Disease ???

I believe that this is incorrect. The reason why ham kit will not
pass muster for acceptance into Marine other services is the ability
of the operator to set the frequency arbitrarily instead of only to
the pre-set channels allocated. A 2m HT (<25W) is permitted a
maximum power in any spurious signal of the lower of 25uW and -40dB
versus the mean power at the fundamental, except that it need not be
reduced below 10uW.

Is the spec for the Marine Service acceptance any tighter than that?

Anyone who knows how to turn the TH-79E into a TH-79A?
The main difference between the two models is that the European version has TX/RX range limited to 144.000-146.000 (European 2m band) . (I do not remember the 70cm frequencies at the moment!)

Also, anyone who knows the RX range of the TM-251A and/or how the TM-251E is turned into a TM-251A ?

I would say 30% of all hams are active and 10% of those are involved in contests. Those 10% walk all over the rest in their piggish ways of hogging the band.

You are right, I should not use the word "all" as you suggested.

And what percentage of hams take part in the above?
And of those that do, ham communication uses 400000 words when 10 will
do. Hams are horribly inefficent voice communicators.

Is that what it thinks it tells you. When I demonstrate ham radio I make no editorial comment. I offer extre credit for it. If I leave the radio on the comment I get is, "you do not talk to those losers do you." Ham radio speaks for itself. Not even Jesus Christ could convince our youth to get on the air with the current crop of old white fat farts.

If you want to talk direct to the student that has no use for ham radio his address is on my WWW site. See him, he is the #1 student in the school with a perfect SAT verbal score. And he knows the score on ham radio.

Quite a thoughtful witty rejoinder. A question begs to be asked, if you don't like Drew's posting why do you repost it in todo? I think ol' Drew has found a button and you clowns are too stupid to ignore him. Calling him names and blasting away with vulgar snipets certainly demeans him and not you (that was sarcasm by the way). Actually I think the point was that CW was an imperfect filter. In an effort to defend the myth of the filter the procoders have exposed even more examples of imperfection of said filter. Keep up the good work.

<snip>

I believe that should they (old timers) not be able to pass the new
"test", then their license drop to a lower standard (basic). The
people who would like to use the TCP/IP over the Ham, should also
have to pass a test for that subject. For example they should have
to pass (TCP/IP , DNS, sendmail, ARP, and RIP) configuration and frame -
packet test. I don't think that the FCC has a test for that, but
HAMS do use it. I also think that the new test should cover IPv6,
which is not out yet, but soon it will be.

The code should stay... for basic... the most current you become with
advanced technology, the higher your license. When a new item comes
available (comm lasors or what ever) then everyone drops on level...
until they pass the new test (10 year cycle).

Really? A 25W VHF high-band transmitter is restricted to spurious/harmonic
output of -60dB/c; I haven't looked at the type acceptance regs for
marine gear lately but I don't recall them being more stringent. The
type acceptance regulations for land mobile and marine gear are intended
to prevent an operator from accidently operating on an unlicensed
frequency, hence type acceptance calls for fixed frequencies and
PL tones.

> But if
>the amateur equipment is used soley as backup to regular marine equipment

Oh, I know what you mean!! I once had a ham lecture me on network
standards, you know, CCITT, IEEE, IAB, stuff like that. When I
wouldn't agree with his wrong assertions, he told me I didn't
know what I was talking about! Oh well, at least I don't have
that problem with the _professionals_ I work with. ;-) ;-)

>with success? 73, Web Williams, KR4WM, City of Myrtle Beach Fire
>Department, Myrtle Beach, SC

Can't argue about saving lives, Web. But somebody will probably argue
that the Myrtle Beach Fired Department does not have the authority
to overide the FCC.

I don't think anyone who is a ham has a problem with you saving lives with
your HT. I would imagine the problem comes in because the overwhelming
majority of the Mod Squad are ambulance chasing wannabe Jr. G. Men, or
broke Cocktails On The Fantail sailors who don't wanna spring for real radios
for the boat. Maybe there is a difference between a professional fireman
who happens to be a ham, and an amatuer sailor who became a ham because
the radios are cheap, I don't know......

I couldn't care less what they do on 26/27 Mhz, but I really get upset
when they come up on 10 meters with their 'freebanding' and interfer with
amateur communications. That's when I fire up the linear and call a lot
of CQ's.

That's an interesting question. The crypto export regulations are
very broad (and very vague). Such a CDROM could be considered a
cryptographic device, and thus be banned from export.

Newsletter editors please note:

The In Brief item Club marks 45 years contained an incorrect date for the special event operation of W3AA. The station will operate for the entire month of March. Here's a corrected version of this item:

* Club marks 45 years: The Phil-Mont Mobile Radio Club will operate W3AA--the Franklin Institute Station in the Philadelphia Science Museum--as a special event station for the month of March to celebrate the 45th anniversary of operation of the club station, formerly W3TKQ. Operation will be in the General portions of most bands. Other frequencies include 14.230 MHz SSTV, plus 3.990, 14.250, and 18.140 MHz. Certificates will be available for a self-addressed, stamped envelope. For more information on W3AA, visit the Web site at http://www.fi.edu/tfi/exhibits/w3aa.html. For more information on the club, set your browser to http://www.comcat.com/pmrc.--Stephen Hoch, WU3I

A trip to my home page reveals there are many good files and programs for amateur radio operators that want to use Mac computers.

<http://www.mv.com/ipusers/wd1v/>

* Ham Radio Test Simulators - where you can go from Novice to Extra Class practicing the actual tests right on your Mac! Check out the info on the new NO CODE license or scramble your neurons and learn Morse on the Mac too!

* Macnet Roster - a virtual "Who's Who" HyperCard stack with more than 780 entries giving the names, addresses, phone numbers, of radio operators all over the world that are using Macs. Check out their projects and their passions and put a design on your Mac Radio future when you see what neat things are being done!

* Mac Ham Radio Software Listing - as the name implies, its "The List" of the latest - much of it with FTP links so what you see is what you can get with just a click. Many of the programs listed on right there for FTPing.

* Ham Radio.FAQ - compiled on a Mac with a lot of links to great Mac FTP sites for radio, electronic engineering, and similar data.

SB QST ARL ARLB010
ARLB010 Section Manager election results

Ballots have been counted in the Section Manager elections for the Arkansas and Northern Texas Sections. Terms of office begin April 1, 1997.

The results are as follows:

In the Arkansas Section -
Roger W. Gray, N5QS, 525 votes
E. Glenn Wolf, Jr., AB5RQ, 185 votes
Gray was declared elected

In the Northern Texas Section -
Bob Adler, N5NY, 785 votes
Dave Allen, WD8LDY, 146 votes
Bill Revis, KF5BL, 470 votes
Adler was declared elected

Eight other sections were not contested. The following were declared elected:

In the Arizona Section
Clifford Hauser, KD6XH

In the Iowa Section
James Lasley, N0JL

In the Idaho Section
Mike Langrell, AA7VR

In the Kentucky Section
Bill Uschan, KC4MIS

In the Mississippi Section

> precious for that.
>

Ah, yes, and if you look at the figure on page 6, the "E" has a jumper
at W301, while the "E3" does not, And in Table 4, the TX-RX Unit number
for the "E" is X57-4402-71, while the "E3" us X57-4402-73. Do the X57
indicators imply the configuration of jumpers and/or diodes, or
different firmware? Things may be more comples than just moving diodes
and cutting wires. It's confusing (probably on purpose).

Hello, this is Harry Miller KB6CGG in sunny California. In going thru my things, I found an interesting item. It is a Glen Model 326-2 broadband power amplifier. They say it was especially suited for driving tube type equipment requiring high input levels, or capacitive type inuts requiring high input power such as on some transistor type equipment. If is very small 1/2" x 1-1/4" x 2". It has a power gain of 10DB and a frequency range of 3Mhz to 30Mhz and requires a voltage of 9 to 16 VDC. I have two of them and they come with complete instructions and schematic. Price $10 each, mailed.

If interested, please email me hmiller@fix.net for further details.

Tnx es 73 Harry KB6CGG

Well, good luck. There are a number of other ham organizations out there,
not necessarily against the ARRL, and none has the numbers or the ear of the
regulatory agencies the way that the League does. And, even at 172,000+
they don't have the numbers they'd like to have.

Maybe the no-code enthusiasts could start an organization like FISTS, only
with the idea of eliminating the code requirement. :-)

Thanks for saving lives! We all appreciate your efforts. However, the
AUTHORIZATION from the FIRE DEPT. doesn't mean squat. They don't have
the autority to authorize this - it must be done by the FCC. And while
use of ANY frequency is allowed in an emergency (when you can't
obtain help on a ham frequency, you no doubt could have
found another ham to call the accidents in to, instead of using
the Fire Dept. frequencies.

Great article in this month's Popular Communications regarding "freebanding" or "outbanding."

Unlike most biased articles which tend to heap scorn on "those dirty outbanders", this one is very objective and tells it like it is. Accurately depicts the millions of freebanders, why they do it, the extreme unlikelihood of being caught, and ham radio's "dirty little secret"...that many licensed hams are also active freebanders because of the informal, less "stuffy" atmosphere on 26/27Mhz.

Announcing NEW
Ham Radio.FAQ

This is the second generation of the original file that was
a regular USENET posting entitled

"rec.radio.amateur.misc Frequently Asked Questions"

The NEW Ham Radio.FAQ is a HyperText document that is on the
WWW and it contains 3 chapters plus hundreds of LINKS to radio
related sites!

1 - Introduction to the Ham Radio.FAQ
2 - Amateur Radio Organizations, Services, and Data Sources
3 - Amateur Radio Advanced and Technical Questions

Please provide a copy of the Ham Radio.FAQ to any new or
soon-to-be Hams that you know or share with them the URL to this
site:

http://www.mv.com/ipusers/wd1v

Send me an EMAIL <or packet with your Email address> if you want the
FAQ text file sent to you as an attached <120 K> file with the words
"HAM FAQ" on the subject line.

Send me a formatted disk with SASE disk mailer if you want the
FAQ text file sent to you on disk. PC or Mac are fine.

In article <jlowmanE5rIE3.BMx@netcom.com>,
Jim Lowman <jlowman@netcom.com> wrote:
>This bit of avoiding cell phone charges is a particular peeve with me. Same
>goes for XYLs who got licensed only to stay in touch with the OM.

I agree with you about treating an HT like a cellphone, but I don't have any problems with XYL's (or other family members) getting a license just to talk with their OM's. The reason is because you never know where that might lead given that there is an active example in the family that is doing more than "just talking". (Besides there are lots of hams who only use their licenses to ragchew with their buddies, why make a special case of XYL's and their OM's?) Even if XYL's *only* talk to their OM's I think there is still an overall benefit just because the XYL is more understanding about the OM's activities.

But in my case at least, I can point to the fact that after my XYL got her license "just" to talk to me, she now comes out on Field Day and is available as an assistant for testing new radios. Further, there are so few women who are hams, that just their presence is positive. (This isn't an affirmative action argument, though it may sound like it, because the women did have to pass the same tests; having passed the tests, it's only a question of what is "appropriate" use.) Finally, my daughter, as another example, also got her license "just" to talk about a year ago and recently soldered her first joint, built her first kit, and has now added engineering as a possible career choice for college someday.

Hi Mark,

You might take a look at our program, DXtreme ARSL: The Amateur Radio
Station Log(tm). It is a powerful, easy-to-use, and affordable
logging program for PCs running MS-DOS 5.0+.

Send me your address and I'll send you a data sheet. Better yet,
visit us "On the Web" where you can read all about it and even
download a free demo version. The URL is:

http://www.qth.com/dxtreme

Please let me know what you think? Thanks and ...

73,

Bob Raymond, NE1I

Hale-Bopp Becoming An Impressive Sight

At 05:00 PST this morning I went outside to take a look at comet Hale-Bopp. My observing location isn't the best; I'm only about 20 km from the outskirts of the San Fernando Valley and the light pollution is so bad that I can barely see the brightest patches of the Milky Way.

In spite of this, I immediately spotted the comet with the naked eye. It was about 15 degrees above the east-northeast horizon and looked like a fuzzy star.

It was almost as bright as the stars in the Big Dipper. I estimate the comet's brightness to be about magnitude +2.6.

Through my 10X50 binoculars I saw a small, bright nucleus. The tail was about 4/10ths of a degree long. Both the nucleus and tail were white with no detectable color.

Owens Lake Astronomy Expedition in Two Weeks

Two weeks from today I plan to take a trip to the eastern side of Owens Lake to assess the light pollution there. This site was chosen because it's twice as far from Los Angeles and Bakersfield than Mount Pinos and should be much darker.

My current employment situation may prevent me from driving to my preferred Hale-Bopp observing sites of central Nevada or Escalante, Utah. Thus, a closer alternative is needed and east Owens Lake may fit the bill.

I'm looking for others who may want to drive up to the site with me or meet me there. I'd be leaving the Thousand Oaks area at about 08:00 and arrive in the vicinity of the site at about 13:30. After a few hours of photographing satellites and deep sky observing, I'd pack up and head for home (I might consider getting a hotel room and staying until Sunday morning).

The roundezvous point will be the intersection of state routes 136 and 190 on the east side of the lake bed. Plan on being there at 15:30.

If you're interested in joining me, contact me at my e-mail address.

Next Vandenberg Launch in Six Weeks

The next scheduled launch from Vandenberg AFB is a refurbished Titan II (not a Titan IV, a Titan II) carrying a DMSP weather satellite. The launch time is unknown. Details regarding this event will be posted on my web page as they become available.

Minuteman III Launch Fiasco

Two weeks ago, several of us stayed up late for two consecutive nights to watch a Minuteman III launch from Vandenberg AFB. On the first night, we didn't see anything at the scheduled 00:01 PST launch time. A fellow ham radio operator made a telephone call and found out that there was a problem and the attempt had been scrubbed.

The next night was a repeat of the first. The 00:01 launch time came and went with nothing happening. The same fellow made a phone call and learned that there was the same problem as the night before (a malfunctioning radar in Hawaii) and the Minuteman III probably wasn't going to be launched.

At 00:15, my friend Bob (KE6YLD) and I left our observing site and drove home. I took a shower, removed my contact lenses, and settled into bed. At 00:42 I saw a bright glow through the bedroom window. The Air Force did launch the missile .... but they were 41 minutes late and we had no easy way to learn of the delay. Needless to say, I was not happy the next day.

To prevent this sort of thing from happening again, I leased a cellular telephone. If I go to Vandenberg AFB to cover a launch in person, I can call desinated ham radio operators in Ventura, Los Angeles, and Santa Barbara counties. They in turn can pass the countdown status over various 2-meter ham radio repeaters.

If I decide to watch a launch from Ventura County, I'll be able to call a news media liason at the base for the countdown status. I'll then call the designated hams who will pass the news along as described above.

By the way, I'm looking for ham operators to volunteer to help me with this. Before you volunteer, be advised that 60% of the launches occur at midnight or 01:00. Many go at even worse times like 03:30. Also, you'll need to be able to easily get into at least one high-coverage 2-meter repeater (i.e. Broadcast Peak in Santa Barbara, Sulphur Mountain, Mount Disappointment, Palos Verdes, or Catalina Island).

Before this thread get's any further out of hand, I have a couple of
questions:

First of all, this clown is just looking for attention and enjoy's pushing
everyones buttons. He is looking for a response from a large group of
people, and he got it! He's no better than a jammer on your local repeater;
the more you respond to his drivel, the more he enjoy's it. If he is just
ignored, he will eventually go away. Don't give him the satisfaction of a
response, he has shown that he doesn't really care about the issues, he
just like to push your buttons!
Second, he obviously was interested in Amateur Radio at one time, since he
is an Extra Class, and continues to use his call sign in his sig at the end
of every message. I really wonder what his daughter, KA1VBQ thinks about
Amateur Radio? Does he really hate Amateur Radio that much? I don't think
so...His web page has several references, links, etc to Amateur Radio. He
even has some quotes paying homage to CW. Let's see, photo's of him and his
daughter with their call signs prominently displayed, callsign search,
links to Ham Radio info, and obviously very proud to be an Amateur Radio
Operator! At least that's what it looks like from this end!
So Burt, what's the real story? Are you AND your daughter going to give up
your calls? Are you going to continue this rediculous thread? If you feel
such hatred towards the hobby, why don't you show it on your web page? I
look forward to your response and hope you can quit playing this silly game
of yours.

Having sailed short and medium distances for 40 years I read for 3 years ago about the Kon-Tiki balsa raft which, in 1947, transmitted from the Pacific to Norway on a 6 Watts transmitter, in CW needless to say. This lead to my ham ticket and now I find much joice in working CW from my 27 feet sailboat. Last year, on a cruise from Norway to Spain, I had several contact with British and French MM nets but in SSB. I like CW. It is like sailing: slow but you can reach far with a bit of patience. It is also KISS (Keep It Simple, Stupid).
Do anybody know of an MM net for CW? Is there any need for it? My experience is that there is a lot of illegal radios on yachts (shame!). I would like to do something to get yachtsmen to use CW which is also used at sea for radio direction finders, fog horns, sound and light signaling, etc. I think CW has no better place than at sea.

While the tpic of this thread makes intersting reading, there is
something serious here.

We are well into the age of everything electronic -- cash registers,
walkman, watchman, cell phones, cell phones with faxes attached, wirelss
computer printers, wireless internet connections, wireless LANs,
wireless WANs, more cell phones, garage door openers, electronic dog
collars, electronic cat collars, electronic ignition on everything,
wireless tracking devices for UPS packages, remote controls for VCRs,
TVs, stereos, and gas fireplace logs, etc., etc., etc. And it is
getting worse.

How long before someone innocently keys up an HT and crashes the entire
northeastern U.S. power grid?

3953. problem with EASILOG software - please help

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-19 00:00:00 UTC
From: ceeam6@cee.hw.ac.uk
Message-ID: <E5upJp.Fro@cee.hw.ac.uk>
Source record: 204265

Can anyone provide me with a solution to the following problem:

My dad uses Easilog V3.09 to keep his log book stored on the hard drive of his computer (the computer is a very old IBM compatible XT model) but wishes to change computer to a more modern PC. He has a friend who can convert the LOG file from his 5" disk to the required 3" disk.
The problem is, the .LOG file is too large to store on a floppy disk, and consequently cannot be copied from the hard drive to disk in order to transfer the data. Neither he nor myself know much about the software or computer, so can someone tell me if there is a way to get round this, short of having to type all the entries again on a new PC?

If replying to this, posting is OK, but please e-mail me if possible at ceeam6@cee.hw.ac.uk

Thanks.

The 40M and 30M are both 67pF. The size of it should get you the right voltage and current. I think the part number is HT58 plus the capacity specification. The 80M cap is 200pF.

On the Butternut HF6V, can anyone point me to a copy of the
instructions? I have one I took down and stored, then lived in a condo
for several years. Now I have a real QTH again but the markings I put
on the tubing have faded away and I don't know the lengths to use
for reassembly.

In most cases, one can filter both the phone line AND the power connection. For the phone line, you can use nearly any phone-line filter or an FT-140-43 ferrite core with about 15 turns of wire on it. (Radio Shack now sells telephone filters.) For the power connector, wrap about 15 turns of the power lead onto the ferrite core, right where it connects to the answering machine.

A man went to a guts store to get some guts for dinner. He sees a sign remarking on the quality of guts offered at this particular gut store. So he asks the butcher: "How much for Engineer guts?"
"3 dollars an ounce."
"How much for teacher guts?"
"4 dollars an ounce."
"How much for ham operator guts?"
"100 dollars an ounce."
"Why is ham operator guts so much more?"
"Do you know how many hams you need to kill to get one ounce of guts?

> always) spell it correctly.

Well you have the ability to laugh at your self and admit a minor error.
Are you sure you are a ham?

Ham radio defined:

There's just so much more in the world to catch their
eye than a bunch of farts who try to maintain their heirarchy in a
pseudo
secret society, refusing with a vengeance to pass the baton, for fear of
the
tiniest little detail of what's theirs being changed. Even if the change
is
necessary and beneficial to the hobby.

> I have seen you post that comment before. It makes absolutely NO
> sense! "If I have the guts"??? I am confused as to your meaning.

Hams are so gutless that none will meet me on the air to discuss my so
called outrageous views. It is not like I can hit them on the air.

> All kidding aside, my first impression is that you actually do have
> some serious problems. Do you so delusional as to believe that you
> could harm me by merely talking to me?

Maybe not you but most hams I could make look damn silly on the air, not
because I am smarter but I have the facts on my side.

I have the "guts" to talk to
> any human being in this world. Would your conversation be so inane
> that I would die of boredom?

Far less than a TYPICAL ham contact.

I had always imagined it would be an
> interesting conversation. Please explain this "guts" idea. I am
> willing to bet I am not the only one with this question.

You are the only one maybe with the guts to ask.

>Gap?

And here we have an uninformed person who probably never listens or he wouldn't try to make the comparison. When was the last time you heard extreme profanity, death threats, deliberate jamming, malicious interference, or vicious personal attacks on the freeband?

Isn't it ironic how the freebanders, although illegal, constitute a group of people who desire serious but fun communications with one another...and yet, in complete contrast, we have the mayhem on 75 and 20 meters being practiced on a nightly basis by licensed amateur operators..."real hams", no less, since they have passed that all-important Morse test in order to have secured operating privileges on those bands.

3973. Looking for suggestions from Veteran Hams.....73

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-19 00:00:00 UTC
From: Michael Lebron <stanglx@i-2000.com>
Message-ID: <330B3991.F47@i-2000.com>
Source record: 204285

I am looking for a first HT. I cant find any info on comparisons of radios. I would like to know what radio would be the best and/or what manufactorers to stay away from. I have been looking at the Yaesu FT50 and FT51 also the Kenwood TH79AD. Does any body own any of these radios.? If so please let me know if you like the way it opperates or not. Also If any of you have any other comments or suggestions I would greatly appreciate it.
Thank You, 73

Michael Lebron

I have the safety 1st baby monitor, and I was wondering, is there any way to modify it, so that I can get more output range on the transmitter? I am not worried about eaves droppers, as I am WAAAAAAAY out, and I need a was to monitor the baby while he sleeps, about 50 yds or so away, in my computer room, it barely makes it that far now, lots of static, so i guess i need to "tune up" the transmitter.

Thanks for your help.

Modification such as you want is illegal. Your best solution is a
wired intercom arrangement. That'll easily go the distance, although
you'll need a pair of wires that run from the baby's room to
your computer room.

Yo David in Oceanside -- Rod here in Oceanside. Haven't seen a mail
server but you can access a question pool or generate an exam with some
web sires. Go to URL:
http://pw2.netcom.com/~ac6v/pageA.html#H

Hope this helps.

3979. kW Power levels for AM/FM/TV

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-19 00:00:00 UTC
From: GTerrell@webtv.net
Message-ID: <856410428.14451@dejanews.com>
Source record: 204291

Can anyone tell me the distance 1 kW

of AM would travel in an ideal

situation? In other words, if a AM

station is broadcasting 5kW of power

in a non-directional pattern, how far

of a distance will the signal travel

and still be picked up with a normal

(non-specific dx-type) radio? I

would also like to know this for an

FM and TV station.

Reason? My parents live in Germany

and sometime have trouble picking up

a local US radio station. It's about

100miles away and broadcasts at 150kW

in AM. They are using a GE Super

Radio and a Select-A-Antenna. How

can they improve the signal easily?

I would also like the info. on FM and

TV stations for my own interest.

Please respond to my e-mail address

as I don't have direct access to

newsgroups.

Thanks,

Garry Terrell

WinTone 1.51 Real-Time DTMF decoder/Scanner monitor for Win95/NT is now
available, and it runs 50% faster than before - Making it run great on
most 486 machines! Here are some of the features that are available :

* Real-Time DTMF decoding via your Sound Card
* Extensive Tone Logging/Transformation
* Decoding DTMF tones from WAV files
* Squelch controlled Scanner monitoring to a WAV file
* DTMF Triggers - Launch an event when DTMF tones are heard
* On-The-Fly Save to a WAV file while you are decoding
* Tunable options to fit tyour listening environment
* NOW 50% FASTER - WILL RUN ON MOST 486 MACHINES!!!!

Come take a look for yourself - You wont regret it!

<clip>

Yep, this kids are just that... I believe (now) that unless you have taken
the code test, one does not have the right to diss the test. If the
preson passes the test, then he can call it what ever. If you can not
take the test, and pass... to complain about the test is a good sign
that you don't have a clue.

With that statement, I would like to take back every word I ever spoken
about this test. :) This code should always be part of the advanced
"tests", but the beginnner test should be a no-coder. I also think
that the no-code people who passed, should be limited a little bit
more... and they have to pass the next test in less then a year. I think
one year is more then enough time for any person to pass.

>Gap?

And here we have an uninformed person who probably never listens or he wouldn't try to make the comparison. When was the last time you heard extreme profanity, death threats, deliberate jamming, malicious interference, or vicious personal attacks on the freeband?

Isn't it ironic how the freebanders, although illegal, constitute a group of people who desire serious but fun communications with one another...and yet, in complete contrast, we have the mayhem on 75 and 20 meters being practiced on a nightly basis by licensed amateur operators..."real hams", no less, since they have passed that all-important Morse test in order to have secured operating privileges on those bands.

Burt,

The part that takes guts is to promote this hobby of ours in a positive
way,
bitching and moaning about how bad things are takes NO GUTS AT ALL and
that's
all I've ever seen from your posts. Nothing positive, no creative ideas
just good
ole belly achin.

Do you have guts Burt?

I have the same problem on my 1988 Chevy Corsica. It greatly affects
the AM band on my Sony in-dash CD player. Strong local stations are not
greatly affected, but weaker ones are obliterated when you give the car
some gas.

If the Delco radios do not experience this problem, I would assume the
noise suppression circuitry is inside the radio itself.

FWIW, I had the same radio in a 1982 Chevy Monte Carlo with no problems.

Anyone have any suggestions?

This sort of thing is one of the reasons that all equipment now sold in Europe has to be CE compliant- meaning that it not only must not emit spurious signals (similar to FCC type B), but also must not be *susceptible* to external RF fields, static charges, and so forth. In this respect the Europeans are ahead of us.

Anyone here ever had to deal with the city for a building permit? If you have have please share your story with me. I am having to deal with the city of Dallas and they seem to have a hard time deciding if a Rohn HBX56 with a 6.9 sqft antenna mounted 2 feet above the tower on a 3 foot mast was in conflict with their 60 foot height requirement.

Now, lets do the math together shall we?? 56 + 3 = 59, correct? Correct!

But wait there's more!! On her first phone call she started that it was 64 feet!!!!!! YES!! 64 feet!!! Can you believe that??? What she was doing was adding in the 6.9 sqft wind load AND the 2 feet above the towen the beam was mounted.

People, please be very careful of anyone that holds something as important as this in the balance for you without you checking around to see if they understand what it is you are trying to do and for God sake, make sure you understand how they arrived at the conculsion they did.

I know it's hard to keep from going on a bloody rampage sometimes but you have to bite your tongue.

Please be careful!!!!!!!!!!!!!!!!!!!!!!

The hardest thing in the world is seeing someone doing it the wrong way and keeping your mouth shut about it.

That is quite intresting, and quite true. I have never met such resistance to change before in my life. I have given up trying to find an Elmer, I'll learn what I want to learn on my own. And I will operate the way I want to operate on the bands I want to operate without letting some "old fart" get to me because I don't have the time to learn the code now.....and even if I did, I would have no place to hang a HF antenna living in an apartment (not by choice).

Freebanders are outlaws. They violate the laws of our
country and most of the thrill they get is from realizing
that they are getting away with it.
Yes, there are a few hams that do not behave well and
should loose their license.
Freebanders do not provide any services for their
country or their community and only interfere with
legal operations. They have no standards for their
equipment or for station operations.
In fact they often screw up equipment.
I bought a FT-707 (a 100 watt HF transceiver) sometime ago
that I discovered was used by a freebander. It took
weeks to straighten it out. The first thing I did
was to remove the crystals for 27to 28 MHz. Re-soldered
numerous bad solder joints. And re-aligned the radio.
The transmit ALC was made inoperable and caused it to
produce splatter for hundreds of KHz. The output meter
calibration pot was set to indicate it was producing
200 watts output.
I repaired it and sold it to young a beginning ham
for less than I had paid for it.
Freebanders are a dangerous lot and if I ever locate
one in my community I will report him even if he has
a ham license. In fact, it is worse if the freebander is a ham.
Then he is a ham operating out of band the band limits.

I don't agree with Burt's position, Bruce, but I haven't seen any engineering study which would indicate that the SS signals of the LEOs would adversely impact amateur operations. Frankly, I think their signals would have negligible impact on most amateur operations, including most amateur satellite operations. There might be some impact on traditional EME operations due to the slightly raised noise floor, but that's a very tiny part of amateur activity on these bands.

The real problem is the other way, with the relatively high power narrowband amateur operations causing interference to the LEO's terrestrial users. Due to the near-far effect, nearby amateur operators would overwhelm the SS coding gain and cause interference to the receivers of terrestrial users of the LEO services. That's where the danger to amateur radio lies in this proposal.

Once they have the camel's nose in the tent, and have established an economic interest in the spectrum with a large user base, the interference to their operations by amateurs would serve as an excuse for them to go back and request exclusive access to the spectrum, IE kick the amateurs out.

Of course if amateurs also adopted SS systems, and practiced proper power control (required by amateur regulations, but ignored in amateur practice), there would be negligible interference in either direction. But amateurs appear unlikely to do that voluntarily, so conflict would

be inevitable. And amateurs don't wield either the economic or political power to prevail in such a conflict.

We may win this time, and I've dutifully filed comments supporting amateur radio, but ultimately we can't continue to warehouse spectrum. The pressure to effectively utilize the spectrum will continue to mount, and unless *we* start using it effectively, others ultimately will.

This is deadly serious. The FCC has made it very plain that they will no longer condone warehousing of spectrum. They are in the process of forcing broadcast to give up the spectrum it has warehoused. Congress has mandated that warehoused military spectrum be released. And that leaves amateur radio as the only major warehouser of spectrum left untouched. That can't last long.

Well, it is true that the non-commercial restrictions of usenet have
gone by the boards in practice if not in theory over the past couple
of years. In a way I regret that, but defacto it looks like we'll have
to put up with electronic junkmail from now on. However, usenet remains
a two way street, and it is fair to challenge claims made by advertising
posted to the net, particularly when those claims appear overblown,
unfounded, or contain blatent misinformation.

>after all this is america.

Indeed, and that still includes the right of fair criticism. Though
this is not America for many of the participants in these newsgroups.
It would be wise to remember that this is a forum of international
scope.

Just setup a serial connection between the old and new computers and
do a file transfer. Most comm programs can handle that, or you can
use a dedicated file transfer utility like Laplink.

> figure out.

Actually it is still illegal. You cannot modify any part 15 device to
operate outside of its type acceptance. Even if part 15 allows a baby
monitor to work at 1 watt, if the TA for the one you have is .1 watt it
has to stay that way.

Modifications can only be made by the type certificate grantee (read
"manufacturer").

Is anybody making 900MHz baby monitors? 900 spread spectrum would
probably allow parents to roam quit far from their sleeping
babies....probably too far. How far away from junior do you REALLY want
to be???

>never seems to get hot.

NiCads don't have to get perceptably warm in order to be damaged by persistent overcharging. Even a nodest overcharge causes damage, and the damage will be cummulative. For maximum battery life, don't overcharge <period>.

NiCads require a constant *current* charger, not a constant *voltage* charger. The voltage you measure at the charger terminals is immaterial (as long as it is higher than the battery terminal voltage, it could be 100 volts, and that would still be fine as long as the current is regulated). It is current regulation which is of concern, and the duration over which it is applied, and the state of charge of the battery during application. Good chargers use pulse charging, and sense battery state of charge by looking for a voltage "droop" (a few millivolts) under load at the point where the battery reaches full charge, and *stop charging* at that point. The NC-60 works this way, charging off the car's electrical system doesn't.

If you want to operate the radio off an external power source, it is best to remove the battery while doing so. That way it won't accidentally be overcharged. If you need to charge the battery off the auto electric system, make sure to use a means of limiting charging current to 1/10th C or less, and *stop charging* in time to prevent the battery from being overcharged. (C is the rated battery capacity in amp-hours.) Recharging a NiCad battery to less than full charge does no harm, and a NiCad can support many more partial charge/discharge cycles than it can full charge/discharge cycles.

That's why use of a NiCad "conditioner" to avoid "memory" is a very bad idea. It puts unnecessary wear on the chemical systems of the battery, and the memory effect is mostly myth anyway. It takes *very* special conditions to generate NiCad memory, and you'll probably never encounter those conditions in your amateur career.

Note, use of a wall wart can also allow the battery to be overcharged. For best battery life, avoid these things like the plague, even if one came with the radio. The radio often has a current regulator built in to allow you to charge with the wall wart, but it has no sensing of battery state of charge, and can allow the battery to be overcharged. The radio manufacturers throw in a wall wart with their radios because it is cheap, and because it insures that you'll soon be back for a replacement battery pack.

There are three things you should never do to a NiCad battery. You should never short it, you should never drain it flat, and you should never overcharge it.

You don't want to short a NiCad battery because, besides the possibility of fire, the very heavy current draw can warp the battery plates.

You don't want to ever drain a NiCad battery flat because the weakest cell (and there is *always* a weakest cell, even in a pack which has been carefully balanced) will become reverse polarity, and that will damage the cell and quickly make the pack unusable. (Note, it is Ok to fully discharge *individual cells*, but never a battery pack with series connected cells.)

But the most common way to shorten the life of a NiCad battery is by overcharging it. This forces some of the reactants into irreversible reactions, and quickly depletes the battery's useful lifetime. It can also generate a condition called "voltage depression" which many people mistakenly call "memory". It is not memory, that's a very special condition, but the symptoms are similar.

Follow these easy steps:

1. Unplug receiver

2. Carry it with you to the room that mom is in. (most likely closer)

3. Plug it in.

4. Go back to computer room and finish your work undisturbed.

5. If receiver is wireless, skip steps 1 and 3.

But seriously though, these units are horrible at best. A previous post said that the unit is probably not putting out the full legal power, and I agree. I believe the legal power output on the 49 Mhz band is 80 milliwatts, which should be more than enough to go 50 yards. I have a pair of Radio Shack 49 Mhz walkie talkies, which I used as a baby monitor when my daughter was born. I believe that they are rated for full legal output power. They claim 1/4 mile range, but that is streaching it just a bit. They should very easily cover the distance you need, though. I hooked the unit in my daughter's room up to a 9 volt battery eliminator, and I used a rubber band to keep the unit transmitting. I had to put a small object between the rubber band and the push to talk bar, because the PTT bar did not stick out very far. (I think I used a piece of rubber eraser)

They worked so well that I had a conflict with a women across the street and down a few houses. I was actually stepping on

her baby monitor that was on the same frequency. Since she just bought hers, I told her to take it back and exchange it for one on another channel.

I have taken the code test and still have the opinion that it should be
done away with. It presents an artificial barrier that is detrimental
to the future of the amateur radio service.

>With that statement, I would like to take back every word I ever
spoken
>about this test. :) This code should always be part of the advanced
>"tests", but the beginnner test should be a no-coder. I also think
>that the no-code people who passed, should be limited a little bit
>more... and they have to pass the next test in less then a year. I
think one year is more then enough time for any person to pass.

You think wrong. This fantasy that "anyone can pass CW if they only
work at it." is a load of crap. There are a large number of people who
simply do not have the talents needed to become acomplished CW
operators. One of the reasons the rabid CW crowd insists on fast code
tests is they fear CW cannot stand on its own merits. They will not
admit this but I am sure it is true. Interestingly the anti code test
people are more positive about CW's chances of susvival without the
current test structure. Then ofcourse there is always the hazing aspect
"I had to do it so you do too." but they will not admit that either.

I'm afraid in the long run this argument will be damaging to the
service by driving talented people away and diverting attention from
real threats to the bands. There seem to be a lot of folks who would
rather see the service disapear than change the entrance hurtles.

Drew,

Right now, the freeband is OK, right now even CB is pretty much OK, as soon as the sunspot activity is high, the freeband and CB will make what is happening on 75 and 20 sound pleasant by comparison. I know, I listened to the freeband as well as 11 meters during the last high sunspot cycle. During this time you will find 28.325 just as bad as 14.313. The reason the problem on 75 and 20 is so obvious now, is that those bands have such wide coverage. As soon as that coverage is available on the 27-30 Mhz range, you will find your wonderful freeband will be as bad as anything you have heard.

Think about this, I would think most HAMS would realize the problem is probably not the transmitter but the reciever, and the interference caused by most computers. What is the signal with the computer off? I pick up baby monitors all over the neighborhood with my 6 meter beam antenna and Polytronics receiver. You can tune up the receiver without breaking any laws. Adding an outside antenna is perfectly legal on the receiver, and would probably be the best solution.

I guess in this appliance operator world the answer is always increase the power, get a bigger amplifier, a more powerful radio, not try to solve the real problem, interference, and poor sensitivity of receivers.

Why must we have the pro-code no-code debate in every damned ham radio
related newsgroup. It's a hot button issue in the ham community today, I
understand, but I've heard it beaten to death in the fidonet ham radio
echo,
and in rec.radio.amateur.policy. Why must we endure it here instead of
talking about other aspects of the hobby. I enjoy just plain old
ragchewing with folks, and will handle some traffic when needed. Once I've
gotten myself settled somewhere where a real decent modest hf station is
feasible, I'll probably upgrade and do something with some nts hf phone
nets,
but for now, ragchewing on vhf/uhf fm is about all I can do here.
I still help out at field day, do all sorts of interesting things, and
enjoy discussing other aspects of the hobby with the folks who participate
in them.
Must we be subjected to this same old tired tune every where we go to
discuss the hobby in cyberspace? Is it really necessary to go to every
place in cyberspace where ham radio is the topic and point the finger at
the guy who disagrees with us and say "I'm right you're wrong?" C'mon
people!

Even Better Burt! Since APRS is digital (but you knew that) you need
not hear any of that horribly inefficent blabber. Just objects on a computer
screen.

BTW, As a former police dispatcher and PO (I even worked in Yarmouth,
hey, maybe I arrested you!) I understand your comments about communication.
But it's easy to critisize from the armchair, isn't it? I have been in radio
communication situations in which life depended upon good skills. Since
a lot of that experience was on the Cape, maybe it was a life of someone you
knew. I don't take this stuff lightly.

I still have a cottage in Dennisport BTW (off Old Wharf Rd.) I even have a
weather station there you could monitor if you were on APRS.

I remember when this one guy who was a ham got caught red handed
operating on 27.675, the AFT and FCC along with the AFL/CIO, MADD and
LULAC kicked in his door and heald him at gun point while they took his
ham licens down off the wall and it kept him off of 27.675 for good!
Believe me, it's works!!! wink wink

Well, I admit that my profession is computer science and radio is
primarily a pastime for me, but that doesn't lessen my ability to
read Volume 47 of the CFR and understand the reasons for type acceptance.
I don't need to own a service monitor and get paid to tweak radios to do
that, do I?

If you're trying to bring my credibility into question, please
explain why. Was my comment about the basis of type acceptance
incorrect? Hmm?

Here is another presentation relayed by:

Burt Fisher South Dennis (Cape Cod), Mass.
Amateur Radio Call K1OIK

From: KB8BMN@WB8LYF.#NWOH.OH.USA.NA
To : ALL@ALLUS

Now, many of my comments will be broad-based and do not apply to
everyone
who is a contester, so please if it does NOT apply to you, DON'T write
me
a hate-letter. If my comments DO apply to you, I DARE you to write me
and
try to justify your stupidity.

Contesting is about as old as the radio sport itself. Trying to contact
as many station in a specified period of time is a noble and I
assume, fun activity. I have never done it myself but many hams do. My
first question is, WHERE is the challenge to running 1000, 1200,
1500 watts (and more...you KNOW there are guys running WELL beyond
the legal limit!), all the while splattering your dirty, over
processed "CQ" and "QRZ" 50 Kc in both directions?

Secondly, and this is where this whole editorial comes from, WHY do
you
feel the need to drop your stupid CQ right in the middle of the SSTV
net
freqs? SSTVers as well as AMTOR, RTTY and Packeteers all have to compete
with all sorts of "natural" problems (QSB, QRN and QRM, etc.) but
during
contests a bigger, uglier problem arises. It seems that during
contest
weekends, the morons crawl out of the wood work and forget all
the
protocols...all in the name of contesting. The SSTVers (as well as
the
other digital mode-runners) only have a TINY slice of spectrum that
they
occupy on 20m (14.230 to 14.235). Many SSTVers are FORCED off of the
air
during contests because it is literally impossible to send video with
all
of the splatter and all of the jerks that hear a "clear" freq and just
jump
in and call CQ CONTEST...without asking QRL? first. Do you REMEMBER QRL?

The SSTVers only ask of this little chunk of 20m but we COULD take more.
What would happen if we moved right up next to your favorite DX (fish
in a
barrel) net? SSTVers have been in the same place forever. WHY do
contesters
still insist on CQing there? Isn't there a law about lessening
the
enjoyment of other hams and/or interference?

I am sure there are a half million hams, or more, in America, who have
no
interest in contesting but are forced off thier favorite nets, rag
chews,
skeds and in the case of SSTVers, the only 20m spectrum they occupy,
all
for the sake of "CQ CONTEST".

Maybe chunks of the bands could be set aside for CONTESTING
and
NO-CONTESTING. Any contact made outside the Contesting area would not
count
and any contester heard outside that portion of the band could be
turned
into the contest judges/sponsored and dis-qualified.

In closing, turn your 5000 watt amps DOWN, turn your raspy power-mikes
and
speech processors DOWN and turn your RF saturated brains ON!

Hope you win!

-73 and God Bless,

Andy KB8BMN @ WB8LYF.#NWOH.OH

I have yet to be arrested. You sound like a very competent person.
Yes it is easy for me to bitch but I have paid dues over the years.
Once we could not get hams to help out at a Beach Boys concert at Otis
so my daughter, who was 8 at the time (KA1VBQ) was paired with an adult
Red Cross worker and she did fine.

> I still have a cottage in Dennisport BTW (off Old Wharf Rd.) I even have a
> weather station there you could monitor if you were on APRS.

Call me when you are here. It would be a first for a ham that does not
agree with me to say so in person.

I have a great deal of difficulty in seeing *any* "logic" in the concept
that
in order to assert that something is a stupid waste of time, one must have
stupidly wasted the time one's self ...

I for one would rather have people who are intelligent enough to challenge
stupid wastes of time coming into ham radio than people who lack the basic
intelligence or initiative to ask the question "why?"

Ham radio is supposed to be about experimentation and learning ... having
enough inate intelligence and curiosity to ask "why?" and look for better
alternatives to "conventional wisdom" and conventional methods seem to
be desirable qualties, not undesirable ones.

Burt, Just what are you doing to make ham radio more interesting to the young folks. What are you doing to bring more young folks into the hobby and keep them there??

It is real easy to sit back and spout a lot of hogwash about how boring, and how stupid and all of the rest of the blah blah blah that I see comming from you.

Have you started to put together a high speed packet network, at a speed high enough to use the internet browsers on? If computers interest the kids, Add computers to the radio, only do it at a speed that will hold their interest. If you come to Dayton this year look me up. The Consolidated Electronics Booth as I work for them and get stuck there for the three days. I will introduce you to a friend of mine, in fact several. One started the 19k2 network around here on 440 several years ago. He and I along with hams around the country are trying to get 900 megs off the ground with spread spectrum. All to get more speed so that ham radio can compete with the internet. Another friend is a scout leader, Their class this time around has over 40 students, all looking for that ticket as he has made ham radio interesting to the scouts by arrainging field day out at the scout camp. He has set up a satellite station to work the birds with the boys right there.

Ponder those things Burt, You claim to be an educator, yet you cut, slice and condem rather than teach and enhance. I have kept my silence for a long time now and read what you have said. Perhaps I should continue to keep it, but I feel that someone has to point the truth out to you as you seem to be oblivious of it. There are many of us out here trying to put the ham back in ham radio and make it fun again, both for us and the young folks. Please quit lumping all hams in one heap and cutting us down. You are the one that gives ham radio a bad name to the non hams that read the news groups that you post your tirades to.

Fred ke8tq ke8tq@n8acv.#day.oh.usa.noam

Come to Dayton this year and stop at the TAPR booth to say hello......

In case anyone here is interested in "neat stuff"...
I'd invite you to come browse around my little Website "online
catalog"...

(Requires frames compatible browser.. is that a problem?)

http://www.wonderlink.net/~aoelectr

You might chek back every few days... expect new stuff as often as
weekly!

You might also see what I've got on eBay Auction Web for sale... plus
it's a GREAT place to find "neat stuff" of all sorts!

My eBay 4-sale listing (if I've got stuff presently listed there):

http://www.ebay.com/aw/seller-list.cgi?email=aoelectr@wonderlink.net&c=0

Their home page: http://www.ebay.com/aw/

Thanks for your time!

Special Event Station LM1SKI QRV during Nordic World Ski Championships 1997:

Akademisk Radioklubb LA1K will operate with the special callsign LM1SKI
for the whole duration of the Nordic World Ski Championships 1997 which
are held in Trondheim, Norway from the 20th of February to the 2nd of March.

Operations will be mainly HF bands, modes CW, SSB and RTTY.

Efforts to become QRV on Aurora and EME will be made during the
period of operation, but is not high on priority list.

Another special callsign, LM2SKI will be QRV, operated by members of
Trondheim Group of NRRL.

>could choose to address this question but I rather expect another
>snappy response like the one above.

Oh stop it, Jerry. Most pro-coders really don't see the code as
a filter; that there are lids and riff-raff on HF just goes to show
that anyone with normal faculties can learn code. Regardless, the
HF lids are a tiny minority of all licensed users (certainly under
1000, which means less than 1% - more like 0.1%).

Where you'll hear exceptional behavior is from the CW ops who use
CW as their primary mode. Easy to prove - just tune down to the
CW segments.

Agreed. At that point, they are no longer "freebanders" but rather,
"bootleggers" on 10 meters. If it were me, I wouldn't even get CLOSE to
10m and run the risk of splattering >28Mhz.

The cheapest solution to your problem is probably to buy an amplified speaker to attach to your receiver. Then place your receiver in another room (where it will pick up the signal from the transmitter) and run the wire to the speaker in your computer room. You may have to add a jack to the receiver to plug the speaker in. This solves your problem with no modifications to the transmitter and is perfectly legal. Also, the cost of a new amplified speaker, the wire, and the jack is less than $15.00.

If you like this option, E-mail me and I will be glad to tell you how to do it. It will not interfere with the normal operation of the receiver. The problem is probably interference from your computer or power lines nearby. Most baby monitors will work very well at a range of 50-75 yards. I have the same problem with a wireless intercom in my computer room. Just moving it to the other side of the room solved my problem. Computers are real nasty to any receivers that are placed close to them...

Your comment about not being concerned with eavesdropping concerns me. A person with a good scanner and an outside antenna mounted with some elevation, can listen to your baby monitor from a range of 1-2 miles with no problems at all. It's nothing that you should lose sleep over, but something that I think you should be aware of.

4041. FCC File Changes

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-20 00:00:00 UTC
From: bohnovic@worldnet.att.net
Message-ID: <330bc3ea.1026084@netnews.worldnet.att.net>
Source record: 204176

I copied the following from the FCC FTP site. Note the last sentence. The FCC is going to stop providing the Date of Birth in the l_appl.dat file. I wonder what is motivating them to do this? They do not provde any reason for discontinuing this data.

" 18 February,
1997

The tue.zip file from 2/11/97 is in a file called teu0211.zip. The thu.zip file from 2/13/97 is in a file called thu0213.zip. As of Thursday, 2/20/97, the date of birth found in the appl file will be removed.

Sorry for the inconvenience.

Mike"

They have already stopped providing the reason that a callsign is being purged. In the past they advised if the license had expired or if the licensee was deceased. I wonder what motivated this action.

The static that you hear is coming from that computer of you....
So all you need to do is switch it off...but that is not what you want...
so you have to get used to the static or put in an intercom.

Nicely spotted Bob!
As the green wire is in series with D308, cutting the wire equals removing
D308. That leaves us with an identical diode-matrix for the E2 and the E3,
which have different transmit ranges.....

In reality it was tested that the difference between E2 and E3 is in diode
D304: with D304 it is an E2, without it an E3 (which is equal to E9).

Sigh.... Am I suffering from dyslexia or what is going on here?....

There may be a NOSPAM. in front of my E-mail address.
It is there to fool machines, not people.

I think you may be right there Alan. 36 pounds is a lot, when compared
to the ARRL. In perspective, it is only 2 weeks food bill.

What I think you are suggesting is that the modified radio might
still operate within the specifications needed to qualify for
acceptance after it was modified. That is probably true but it is
also irrelevant. As Bill said, it is illegal to operate the device
after modifying it in any way, even after making an internal change
which deliberately *reduces* the output power.

I'd bet the problem lies in overcharging when you are charging from the
vehicle. How are you charging from the car and how long? I am not sure, but
doubt that the HT has any control over it's charging.

Jim, I appreciate the response. A capacitor across the electrical circuit would seem reasonable (but, it better never short out, I don't know what protection is needed from constant exposure to gasoline).

I have contacted several GM dealers and fuel pump manufacturers. They don't seem to know anything about electric fuel pump noise for hams or CB'ers.

A Cadillac parts man said that Cadillac solved the problem in late 80's or early 90's by replacing the pump with an different design. I did not ask him who the manufacturer was. Contacts at AC Delco denied any knowledge of a "fix". A ham radio operator who works at a Cadillac dealership said that the problem is widespread (affecting Fords, GM and Chrysler). Only Ford offers a RFI filter that can be installed in-line inside the gas tank.

If the FCC confiscated all of your radio gear for violating their rules, you would probably not be so keen on calling the radio spectrum publicly-owned. In all of the history of amateur radio that I have read, the ham operators had to fight others for spectrum rights.

Today the government needs money so they are SELLING spectrum to corporations. Amateur Radio should be considered a private club for these reasons.

>Because I am public service minded person.

I'm glad you said this Burt. The Boston Marathon will be running
on April 21st. We will need additional volunteers. I will be part
of a group using APRS software to keep track of emergency
vehicles. I believe this is a school holiday, so you should be free.

Since you are a teacher of electronics, you should be able to
throw together a tracker if you want to help even more. Simply
interface a GPS unit supplying an NMEA sentence to a TNC
of your choice. Transmit on 145.79 (you can use that 2M
equipment in your closet) . The Shareware is downloadable
from various web sites.

If you don't have, or can't build, a GPS unit, just keep the
serial interface of the TNC free and we can program it with
a laptop.

Maybe we can even put your moped to work!

Anyway, Thanks for volunteering!
73,

Steve

I have heard races covered by ham radio. CBers do better.
Hams are horribly inefficent blabber mouths but I bet your group in
the Boston area actually does a lot of good.

>Today the government needs money so they are SELLING spectrum to
>corporations. Amateur Radio should be considered a private club for
>these reasons.

This is exactly the problem we're facing. Morse code testing is now considered an illogical barrier to obtaining an amateur radio license. This results in fewer amateurs to defend the bands from commercial interests and a wonderful argument for those interests to take frequencies away from "those crusty old ham operators who don't use them much anyway."

Speaking out against the hobby instead of getting out of the hobby
isn't at all gutsy. I'm pro code and people disagree with me. But it
doesn't mean that any of us are speaking against the hobby. If the
hobby isn't for you, then do something else.

>Ham radio defined:
>Mark Schneider, WI1W said:

The choice of using the word necessary is just that - a choice. I
don't agree with Mark. People can argue though about it being
beneficial.

Another thing Burt: Why do you cross-post your opinions to all the
amateur newsgroups when it belongs only in rec.radio.amateur.misc?

ANNOUNCE: WABC TRANSMITTER SITE AS IT IS TODAY Webpage

In addition to my vintage tour through the WABC 77 transmitter site, at:

http://www.exit109.com/~jimh/wabc.shtml

I have added a new photo tour page of the WABC transmitter facility on

my visit last Sunday 2/16/97. URL is:

http://www.exit109.com/~jimh/wabcnow.shtml

Included with photos is plenty of text describing the operation of

the new digital AM transmitting equipment among other things.

I am very greatful to CE, Bill Krause for coming out on Sunday and

taking the time to show me around and explain the operation of the

plant.

Hi Gang --

Would love to get some help on this one. My FT-50 is eating batteries. I've gone through three so far and the original wasn't even a year old.

What happens is after about a day or two the battery won't hold a charge. It never gets too hot to the touch and the NC-60 appears to be putting out about 15 volts. I've also been using it in the car charging from the car system but again reads 15 volts and battery never seems to get hot.

only thing I can think is that some regulation circuit in the HT is out or possibly the thing drains the battery even when it's off but I don't think even that would do it.

ANY IDEAS????

Any of you had similar problems... I'd love to hear from you.
Thanks for the reply.

And here we have an uninformed person who probably never listens or he wouldn't try to make the comparison. When was the last time you heard extreme profanity, death threats, deliberate jamming, malicious interference, or vicious personal attacks on the freeband?

Isn't it ironic how the freebanders, although illegal, constitute a group of people who desire serious but fun communications with one another...and yet, in complete contrast, we have the mayhem on 75 and 20 meters being practiced on a nightly basis by licensed amateur operators..."real hams", no less, since they have passed that all-important Morse test in order to have secured operating privileges on those bands.

>that you don't have a clue.

This is flawed logic. If we were discussing the initiation rites into a private club, this would be a perfectly logical approach. But the resources used here (radio frequency spectrum) are publicly-owned property. Also, the license required to legally use these frequencies is issued by the government. If you don't feel the public interest is being served by the government's requiring knowledge of an antiquated system of communications by beeping noises in order to obtain a license, you have every right to complain...whether you're coded, no-code, or non-ham but would like to be if not for the ridiculous CW requirement.

For the record: I have passed the test but I fail to see any compelling reason for the government to continue to require them as a condition of obtaining any amateur radio license.

What a thoughtful insightful retort, your grasp of the language and debating skills are most impressive. If you indeed have an amateur license could we please know your call sign. You in no way need a license to participate in these newsgroups but if you have a coded ticket it would be an interesting benchmark on the "CW filter". You could choose to address this question but I rather expect another snappy response like the one above.

Jerry

In that, I and other no code supporters have repeated stated we
could and would support. We have suggested the creation of
CW exclusive HF band segments if that would help end the
hypocrassy and bring about some compromise. I'll leave it to
the code test supporters to bring their usual retorts to this
proposal again.

4096. Help: Motorla permacode prob.

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-20 00:00:00 UTC
From: vroy@freenet.edmonton.ab.ca
Message-ID: <5egh8ddjg1@news.sas.ab.ca>
Source record: 204318

I have aquired about 10 motorola pageboy II and III pagers that are
on our commercial UHF freq. It would be very helpful to me to be able to
use these units as recievers. If I break the squelch I am able to transmit
to the units, but what I need to do somehow is to bypass the decoder
section so that the squelch will break without the pager hearing tones.
There are two permacode chips per pager, the lowest freq being 288.5 Mhz.
Our radios will only generate tones up to 250 mhz., or elese I wouls just
put two of the same decoders in one pager. There must be a way of
bypassing the decoder, so that when the pager hears a signal it will break
squelch. Any schematics, or better still instructions as to the best way
of doing this would be greatly appreciated. BTW, I guess I should mention
that these are voice pagers. Please don't post saying that I could use a
scanner or other reciever, as the application that these pager/reciever
units are to be used for is rather specialized.

4097. Rig mounting in Villager

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-21 00:00:00 UTC
From: Gorsline Family <gorslin@pathcom.com>
Message-ID: <330E7869.6ED5@pathcom.com>
Source record: 203969

Has anybody mounted a mobile rig in a Mercury Villager? I've been looking at the tape storage compartment (where optional CD player goes) under the AM/FM radio. It looks big enough, has power nearby and would hide the rig when closed.

tnx George VE3YV / K8HI

4098. ARLX005 HAARP to air test transmission for hams

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-21 00:00:00 UTC
From: w1aw@arrl.org
Message-ID: <$arlx005.1997@arrl.org>
Source record: 203970
Cross-posted to: rec.radio.info,rec.radio.amateur.misc

SB SPCL @ ARL $ARLX005
ARLX005 HAARP to air test transmission for hams

ZCZC AX05
QST de W1AW
Special Bulletin 5 ARLX005
From ARRL Headquarters
Newington CT February 21, 1997
To all radio amateurs

SB SPCL ARL ARLX005
ARLX005 HAARP to air test transmission for hams

The High Frequency Active Auroral Research Program (HAARP) facility in Gakona, Alaska, will transmit a test signal on March 8, 1997, seeking reports from hams and SWLs in Alaska and in the ''Lower 48'' to determine how well the HAARP transmissions can be heard to the south.

During this test, the HAARP facility will transmit on or near the frequencies 3.4 MHz and 6.99 MHz to give listeners the opportunity to listen for the HAARP facility and to claim a QSL card. The test will be conducted beginning at 0430 UTC on March 8 (2330 Eastern Time on March 7).

The format of the test will be to transmit a constant carrier (no modulation) signal followed by a CW message at 10 WPM, according to the following schedule:

TIME FREQ SIGNAL ANTENNA POSITION

0430 6.99 MHz Carrier only Pointed up
0435 6.99 MHz CW message Pointed up
0440 6.99 MHz Carrier only Pointed to SE
0445 6.99 MHz CW message Pointed to SE
0450 3.4 MHz Carrier only Pointed up
0455 3.4 MHz CW message Pointed up

The transmission beginning at 0450 is primarily for Alaskan hams. Reception reports should include signal strength during the constant carrier transmission period along with the text of the CW message.

Complete details on this test and a QSL address will be listed on the HAARP home page at http://server5550.itd.nrl.navy.mil/announce.html.

The HAARP facility--now in the developmental prototype stage--has been undergoing testing since it was completed in late 1994. Multiple transmitters feed multiple antenna elements (there are 48 antenna elements on the site, arranged in eight rows of six columns; however, at this time, only 18 elements are active. The test will use 17 antennas with a net transmitter power of 340 kW). The final configuration could have 180 antenna elements and a combined transmitter power of 3.6 MW. HAARP's stated scientific purpose is to study ''the properties and behavior of the ionosphere, with particular emphasis on being able to understand and use it to enhance communications and surveillance systems for both civilian and defense purposes.'' HAARP is managed by the US Air Force and the US Navy.

For more information, see ''The High Frequency Active Auroral Research Program'' (QST, Sep 1996, p 33), or check out the HAARP home page, http://server5550.itd.nrl.navy.mil/haarp.html.

The ARRL Letter
Vol. 16 No. 8
February 21, 1997

Address Changes: Kathy Capodicasa, N1GZO, e-mail kcapodicasa@arrl.org.
Editorial: Rick Lindquist, N1RL, e-mail elindquist@arrl.org.

IN THIS EDITION:

* Ham radio grows in 1996!
* Marconi memorabilia on the block
* HAARP to air test transmission
* New WATS number for FCC
* ARRL section managers elected
* Solar update
* CW champs to compete in Bulgaria
* Antenna and lightning safety info on Web
* In Brief: This weekend on the radio; FCC drops DOB info; RS-16 launch postponed; Cosmonaut active on ham bands; Girl Guides of Canada calling; Congratulations!; Rescheduled; Address clarification; MARC celebrates 50 years

---

HAM RADIO GROWS IN 1996

Good news: The number of licensed Amateur Radio operators in the US rose by approximately 1.9% last year! FCC statistics show that ham ranks increased by 12,207 from December 1995 to December 1996. During 1996, 28,854 new licenses were issued by the FCC, while another 13,926 hams upgraded their operating privileges.

Not-so-good news: During January 1997, the total number of hams dropped by 641 (possibly due to the cancellation or expiration of the licenses of deceased hams). The number of new and upgrading hams also was off slightly last month compared to the month previous.

Bad news: The number of applications forwarded to the FCC by the ARRL-VEC for new and upgraded licenses during 1996 was down by 5198 over the previous year. That represents a 16% drop--consistent with what other VECs are reporting.

MARCONI MEMORABILIA GOES ON THE MARKET

Rare memorabilia from the collection of Guglielmo Marconi, the man usually credited with the invention of practical wireless, will go on the auction block at Christie's South Kensington auction house in London this spring. The two-day sale, April 24 and 25, 1997, is expected to fetch one million pounds (approximately $1.6 million). Christie's says the collection "charts the history of radio from Marconi's arrival in England in 1896 through to the end of World War II." (Marconi died from a heart attack in 1937.)

Sale proceeds will go to "Marconi Days," a new educational initiative that will train up to 1000 electronics teachers each year. The sale will be sponsored by GEC-Marconi as part of its Marconi centenary celebration.

Christie's says the collection "comprises an important cross section of early equipment and experiments" as well as "important technical, business and personal papers." Among the individual items offered for sale is Marconi's 1896 first patent for "Improvements in Wireless Telegraphy" (estimated to be worth $1600 to $2400). Sale highlights include some of the earliest recorded wireless messages, including the first use of wireless to report on a sporting event--the Kingstown Regatta in Dublin, Ireland, in 1898 (estimated value, $4700 to $7900).

Offered with a number of early tubes ("valves") developed by John Ambrose Fleming is Fleming's November 1904 letter to Marconi in which he reports the invention of the "valve" for the first time, and declares, "I have not mentioned this to anyone as it may become very useful." One such "valve" is estimated in value at approximately $8000 to $13,000.

A circa-1900 Marconi coherer receiver will also be offered. Christie's values it at between $23,600 and $31,500. Other items include a microphone used by the singer Dame Nellie Melba, who broadcast from a Marconi transmitter in Chelmsford, England. The microphone features a mouthpiece fashioned from a cigar box and signed by the singer. It's expected to sell for up to $12,600.

Prior to the sale in April, Christie's will exhibit highlights from the Marconi archive centenary sale in the US and Italy. For more information, check Christie's Web site at http://www.christies.com/, or e-mail marconi@christies.com.

HAARP TO AIR TEST TRANSMISSION FOR HAMS

The High Frequency Active Auroral Research Program (HAARP) facility in Gakona, Alaska, will transmit a test signal on March 8, 1997, seeking reports from hams and SWLs in Alaska and in the "Lower 48" to determine how well the HAARP transmissions can be heard to the south.

During this test, the HAARP facility will transmit on or near 3.4 MHz and 6.99 MHz to give listeners the opportunity to listen for the HAARP facility and to claim a QSL card. The test will be conducted beginning at 0430 UTC on March 8 (2330 Eastern Time on March 7).

The format of the test will be to transmit a constant carrier (no modulation) signal followed by a CW message at 10 WPM, according to the following schedule:

TIME FREQ SIGNAL ANTENNA POSITION

0430 6.99 MHz Carrier only Pointed up
0435 6.99 MHz CW message Pointed up
0440 6.99 MHz Carrier only Pointed to SE
0445 6.99 MHz CW message Pointed to SE
0450 3.4 MHz Carrier only Pointed up
0455 3.4 MHz CW message Pointed up

The transmission beginning at 0450 is primarly for Alaskan hams. Reception reports should include signal strength during the constant carrier transmission period along with the text of the CW message.

Complete details on this test and a QSL address will be listed on the HAARP home page at http://server5550.itd.nrl.navy.mil/announce.html.

The HAARP facility--now in the developmental prototype stage--has been undergoing testing since it was completed in late 1994. Multiple transmitters feed multiple antenna elements (there are 48 antenna elements on the site, arranged in eight rows of six columns; however, at this time, only 18 elements are active. The test will use 17 antennas with a net transmitter power of 340 kW). The final configuration could have 180 antenna elements and a combined transmitter power of 3.6 MW. HAARP's stated scientific purpose is to study "the properties and behavior of the ionosphere, with particular emphasis on being able to understand and use it to enhance communications and surveillance systems for both civilian and defense purposes." HAARP is managed by the US Air Force and the US Navy.

For more information, see "The High Frequency Active Auroral Research Program" (QST, Sep 1996, p 33), or check out the HAARP home page, http://server5550.itd.nrl.navy.mil/haarp.html.--Ed Kennedy, K3NS

NEW WATS NUMBER FOR HAM INFO FROM FCC

The FCC has designated a new, toll-free (WATS) number for Amateur Radio license inquiries--including inquiries about vanity and new call signs. The new number, 888-225-5322, will connect callers to the FCC National Call Center, handled by the FCC's Consumer Information Bureau.

Callers to the old consumer information number will get a message referring them to the new number.

ARRL SECTION MANAGERS ELECTED

Several ARRL sections will have new section managers starting April 1.

Ballots were counted this month for SM elections in Arkansas and Northern Texas. In Arkansas, Roger W. Gray, N5QS, of Searcy, Arkansas, outpolled E. Glenn Wolf Jr, AB5RQ, of Pine Bluff, Arkansas, 525 to 185 votes. Gray succeeds George Mitchell, KI5BV, of Pine Bluff. In North Texas, incumbent SM Bob Adler, N5NY (ex-NZ2T), of Southlake, Texas, topped the field in a three-way race. Adler had 785 votes to 470 for challenger Bill Revis, KF5BL, of Irving, Texas, and Dave Allen, WD8LDY, of The Colony, Texas.

Uncontested candidates--including several incumbents--were declared elected in eight other ARRL Sections: In the Arizona Section, incumbent Clifford Hauser, KD6XH, of Tucson; in the Iowa Section, incumbent Jim Lasley, N0JL, of Chillicothe; in the Idaho Section, incumbent Mike Langrell, AA7VR, of Boise (Langrell was appointed earlier to fill the vacant SM position); in the Kentucky Section, Bill Uschan, KC4MIS, of Frankfort (Uschan replaces Steve Morgan, WB4NHO, of Owensboro); in the Mississippi Section, incumbent Ernie Orman Jr, W5OXA, of Biloxi; in the Montana Section, incumbent Darrell Thomas, N7KOR, of Great Falls; in the Orange Section, incumbent Joe Brown, W6UBQ, of Riverside, California; and in the Wyoming Section, Robert Williams, N7LKH, of Wapiti (Williams replaces Warren "Rev" Morton, WS7W, of Casper).

SOLAR SLUMP CONTINUES

Sun watcher Tad Cook, KT7H, Seattle, Washington, reports: Solar activity continues low, with flux values still running lower on every day than the average for the previous 90 days, which dropped this week from 78 to 77. Geomagnetic indices rose on February 17 with estimated planetary K indices as high as 5. But, low solar and geomagnetic activity is good news for the 160 meter contest this weekend. Expect good conditions throughout the contest, with little threat of a geomagnetic upset.

For the next few weeks conditions are expected to stay the same, with solar flux in the low to mid 70s. The latest long term forecast shows the next solar cycle peaking just three years from now. This poses the question: Why haven't we seen much activity yet from the new cycle? The projection is based upon previous cycles and indicates an average sunspot number of 19 for January and 22 for February--with the number doubling to 44 by July. It also shows solar flux of 77 for January, 80 for February, 84 for March, and 100 by July. Currently it appears that actual conditions are lagging behind these projections.

Sunspot numbers for February 13 through 19 were 0, 0, 0, 0, 0, 13 and 15, respectively, with a mean of 4. The 10.7-cm flux was 71.1, 71.3, 71.8, 72, 73.1, 72.9 and 72, respectively, with a mean of 72. Estimated planetary A indices for the same period were 4, 5, 4, 8, 17, 7, and 3, respectively, with a mean of 6.9.

WORLD CHAMPIONSHIP IN HIGH SPEED TELEGRAPHY SET

Who says CW is dead? Limber up your fists and break out the code practice tapes, because the Second IARU World Championship in High Speed Telegraphy (HST 97) will be held October 6-10, 1997, in Sofia, Bulgaria. Participants may enter one of six categories:

A--female juniors, age 20 or younger.
B--male juniors, age 20 or younger.
C--women, age 21 to 39.
D--men, age 21 to 44.
E--female "old timers," age 40 or older.
F--male "old timers," age 45 or older.

IARU member societies--including the ARRL--are being invited to field competitors. The deadline to apply is April 6, 1997. CW-proficient ARRL members interested in participating at their own personal expense as Team ARRL should contact Dave Sumner, K1ZZ, at ARRL HQ (e-mail, dsumner@arrl.org or write him at 225 Main St, Newington, CT 06111) as soon as possible. The sponsoring Bulgarian Federation of Radio Amateurs (BFRA) says it expects more than 150 participants from more than 15 countries to turn out.--BFRA

ANTENNA AND LIGHTNING SAFETY INFO ON THE WEB

Andy Funk, KB7UV, assistant news operations manager at WAGA-TV, in Atlanta, Georgia, has posted some information on his station's Web site that's potentially useful to hams. The Microwave ENG Safety and Operations Guidelines are aimed primarily at the station's newsroom personnel using WAGA's electronic news gathering (ENG) vehicle, which has an extendable microwave mast and antenna on top. But many of the same rules apply to Amateur Radio antenna erection. The page also includes some new information on lightning safety--based on tips from the National Lightning Safety Institute.

Some basic safety rules worth repeating:

Electrical lines can cause serious injury or death.
Keep all people, tools, and equipment at least 15 feet from all overhead wires.
Overhead lines are not insulated. They should not be touched.
Some lines have a weather covering and appear to be insulated, but they are not.
Stay away from electrical devices such as meters, transformers, and substations.

For more information, set your browser to http://wagatv.com/ENG/ on the Web (this address is case-sensitive).

IN BRIEF:

* This weekend on the radio: The CQ WW 160 Meter DX Phone Contest, the YL/OM Phone Contest, the REF French Phone Contest, North Carolina QSO Party, the RSGB 7 MHz Contest, UBA CW Contest, the CQC Winter QRP QSO Party, and the FYBO Winter QRP Field Day will all compete for your participation. Please see February QST, page 103 for details.

* FCC drops DOB info: Effective February 21, 1997, the FCC no longer will distribute date-of-birth information as part of its Amateur Radio license data. The field has been physically removed from the data stream. At least some call sign lookup systems could be affected by this change.

* RS-16 launch postponed: The launch of the anticipated RS-16 satellite has apparently been delayed. The Start-1 rocket will instead be used to launch a commercial remote sensing payload belonging to the US. RS-16 may be launched at the end of February. The launch had been expected as early as December and has already been delayed once. The new satellite is expected to be a

Mode A (2 meters up/10 meters down) bird, like RS-10 and RS-15.--SpaceNews

* Cosmonaut active on ham bands: CE3LWV, PY2FXE, and VE7VDX all report that Russian Cosmonaut Valery Korzun has been very active as R0MIR from the Mir space station, using an uplink of 145.200 MHz and downlink of 145.800 MHz. All stations reported good signals from Mir. He reported that US Astronaut Jerry Linenger, KC5HBR, has not been on the air very much because he has been very busy with experiments on Mir.--SpaceNews

* Girl Guides of Canada calling: Listen for VE7UBC (or possibly the special call sign of VE7GGC) as the Girl Guides of Canada take to the airwaves Saturday, February 22, 1730-2015 UTC (and possibly longer). Announced frequencies are 3.733-3.933 MHz; 7.088 MHz; 14.133, 14.188 and 14.288 MHz and 21.360 MHz.--Dave, VE7CNV

* Congratulations! ARRL Roanoke Division Vice Director Dennis Bodson, W4PWF, recently received the George S. Wham Leadership Medal from the American National Standards Institute (ANSI). The award is given for "long-term leadership and visionary qualities in support of the ANSI Federation."--IEEE Standards Bearer

* Rescheduled: The TV appearance of John Creel, WB3GXW, of Silver Spring, Maryland, has been rescheduled to the March 5 edition of ABC Television's Prime Time Live. He will be interviewed by Chris Wallace. The program airs at 10 PM Eastern Time. Creel is an investigator with the Montgomery County, Maryland, Division of Consumer Affairs. The story to be aired concerns the problem of buying cars from unlicensed car dealers (so-called curbstoners) and odometer fraud. Creel has been a ham for 20 years and is a member of the Laurel (Maryland) Amateur Radio Club, where he's active in the VEC program. He also operates two repeaters in the Silver Spring area.--Mark Doore, N3NTQ

* Address clarification: An e-mail address to send comments about the benefits of differential global positioning system (DGPS) radio beacons has been fixed and should now work (see "Hams using APRS and GPS asked to contribute to DGPS study," The ARRL Letter, Vol 16, No 6, February 7, 1997). Comments may be sent to John F. "Ted" Pugh at pugh@farradyne.com, tpugh@farradyne.com or pught@farradyne.com.

* MARC celebrates 50 years: The Meriden (Connecticut) Amateur Radio Club observes its 50th anniversary this year. The club's "in memoriam" call sign, W1NRG, formerly was held by Ed Bisschert, a club member and World War II Navy veteran radioman who died in 1952. The 100-member club has one 50-year member--Frank Darmofalski, W1FD. MARC members are active in public service communication and operating events. Bill Wawrzeniak, W1KKF, is the current president. For more information, visit MARC at http://pages.prodigy.com/marc/marc.htm on the Internet.

In case you missed the number of birds...
From Edupage:

TELEDESIC LOOKS AT SCALING BACK
Teledesic Corp., the high-profile, $9-billion satellite communications project backed by cellular magnate Craig McCaw and computer mogul Bill Gates, is exploring options to scale back its 840-satellite system, beginning initially with just 288 "birds." The satellites will occupy a low-Earth orbit, 400-700 miles above the Earth, circling in 12 orbital planes or "rings," with 24 satellites in each ring. A spokesman for Teledesic says the company "has not altered" its original plan, but may start off with a more modest arrangement. (Wall Street Journal 19 Feb 97)

You also need to know how the radio works, and the best way to
gain that knowledge is to build one. CW transmitters still stand
out as the easiest apparatus to build; you gain a wealth of under-
standing regarding RF electronics, construction practices, modifi-
cation for optimum performance, all without the heartache of failure
that can result from attempting to build more complex modes. And there
is really nothing more satisfying than contacting others thousands of
miles away with something you've built yourself.

Amateur radio is still about operating, and while in the field,
if something breaks, one should be proficient and feel comfortable
enough to trouble-shoot the rig and attempt a repair. The
experience gained from building will give you that proficiency.
Cessation of operating due to an otherwise easily repairable malfunction
makes you nothing but a plug&play operator <spit>. It might take a
well-needed radio and operator out of the action at a time when
desperately needed.

Hello Bill,

Maybe I have been inactive too long, but what are "FREEBANDERS" and
where do they operate?

This is true. You can't see a thing on his web site unless you let him execute Media Player on your machine. I've got a problem just allowing executables being sent to, and run on my machine to suit someone elses whim. With this guy's attitude, who knows what you'd end up with.

Best and cheapest method I found was to put a drop or two of good old cooking oil on the label before removing or on the tacky spot and after about five minutes rub it off

If it's still on sale, Radio Shack has a very good stereo headset (stereo mini plug) with 600 ohm electret boom mic (mono mini plug) for $29. I use one on my TS-430s and find that it is strikingly "similar" to one of the new Heil headsets with replaceable boom mic elements for DX or ragchew. Go take a look.

Dear Friend,
Five minutes and five dollars can change your life!!!THIS IS
THE FAIREST, MOST HONEST WAY I KNOW TO SHARE THE WEALTH! Would you
like to make thousands of dollars, quickly, legally, with NOCATCH?
Then keep reading..... please take five minutes to read thisarticle;
it will change your life, just like it did mine. It's true! You can
make up to, or over, $50,000.00 in 4 - 6 weeks; maybe sooner! I SWEAR
I'M NOT LYING TO YOU, AND THIS IS NOT A SCAM! If you're interested,
keep reading; if you're not, I apologize forwasting your time.

Here we go. A little while back, I was browsing through these
newsgroups, just like you are now, and came across an article similar
to this that said you could make thousands of dollars in weeks, with
only an initial investment of $5.00!! So, I thought, "Yeah, right,
must be a scam", but, I was curious, like most of us are, and kept
reading. Anyway, it said that you send $1.00 to each of the five names
and addresses stated in the article. You then place your own name and
address in the article at the bottom of the list at #5, and post the
article in at least 200 newsgroups, (there are thousands). No catch,
that was it! So after thinking it over, talking to a few people first,
I tried it.I figured what have I got to lose except for 5 stamps, and
$5.00, right? Well, guess what....within 7 days, I started getting
money in the mail! I was shocked! I still figured it would end soon,
and didn't give it another thought. But then money kept coming in ,
tripling in size and multipying by 10 - 20 times the amount that I got
the first week! In my first week I made about 20 - 30 dollars. But,
by the end of the second week, I had made a total of over $1000.00!!!!
In the third week, I had over $10,000.00, and its still growing.
This is my fourth week, and I've made about $42,000.00 TOTAL, and the
money is still coming in.....Let me tell you how this works, and
most importantly, WHY it works, also, make sure you print a copy of
the article NOW, so you get the information off of it, and begin
making money.The process is very simple, and it consists of 3 EASY
steps:

STEP 1: Get 5 separate pieces of paper and write the following on
each sheet of paper...."PLEASE PUT ME ON YOUR MAILING LIST", and then
write your NAME AND ADDRESS. Get five $1.00 bills and place ONE
inside each piece of paper that you just wrote on. Fold each paper so
the bill will not be seen in the envelope, (otherwise, nosey people
who like to steal envelopes with money in it won't get yours). Put
one paper inside each envelope, and seal it. Do the same for all
five. You should now have 5 envelopes, sealed, EACH with a piece of

paper AND a $1.00 bill, stuffed inside of the paper. Make sure those words that were stated above, are written on each paper. What you are doing is creating a service; this is PERFECTLY LEGAL. Now then, mail the 5 envelopes, with the paper and $1.00 bill in each, to the following 5 addresses:

1. D. Ellis, 8301 W. 92nd St., Overland Park, KS 662122.

2. J. Krakowiak , 1112 W. Broadway #1, Anaheim, Ca 928053.

3. J. Sides, Lamar Box 1, South Plains College, 1401 S. College Ave.,Levelland, TX 79336

4. Areg Mkrian, 15 Alma Ave. Belmont, MA 02178-4404

5. A Karns, 4000 NW 53rd, Oklahoma City, OK, 73112

STEP 2: Now take the #1 name off the list that you see above, move the other 4 names up, (5 becoming 4, 4 becoming 3, etc.), and put YOURNAME as number 5 on the list. You can slightly alter this article ifyou need to; editing what you need to edit.

STEP 3: Post your amended article, (with your name at #5), to at least 200 newsgroups, (There are close to 19,000 of them). HOW TO DO THIS:If you are using Netscape 3.0, do EXACTLY the following:
1) Click on any newsgroup, like normal, THEN click on 'TO NEWS',which as on the far left when you're in the newsgroup page. This will bring up a box to type a message in.
2) Leave the newsgroup box like it is. CHANGE the subject box to something flashy, like, "NEED CASH $$$ READ HERE $$$" or "FAST CASH"!!
3) Tab once, and you should be ready to type. Now, re-type, (onlyonce), this WHOLE ARTICLE WORD FOR WORD, except to insert your name at#5, and to remove #1 off the list; plus any other small changes youthink you need to make. Keep most of it the same!!
4) When you're done typing the WHOLE article, click on FILE in THISBOX, right above send, not where it says Netscape News On The FirstBox. Click on SAVE AS when you're under FILE. Save your article as a text file to your C: or A: drive. DO NOT SEND OR POST YOUR ARTICLE UNTIL YOU DO THIS. Once saved, move on to number 5 below.
5) If you still have all of your text, send, or post, to this news group, now, by just clicking send; which is located below FILE, and right above Cc:.
6) Here's where you're going to post all 200. OK, click on any newsgroup, then click on 'TO NEWS', again, in the top left corner. Leave theNEWSGROUPS BOX alone. Again, put a flashy subject title in the SUBJECT BOX. Hit TAB once you're in the body of the message, and then click on ATTACHMENTS, which is below the SUBJECT BOX. You will get another box to come up. Click on ATTACH FILE, then find YOUR file that you saved; click once on the file, and then click 'OPEN'. Now click on OK. If you did this right, you should be able to see your file name in the attachments box, and it will be shaded green.If you use IE EXPLORER, it's just as easy......HOLDING DOWN THE LEFT BUTTON,

HIGHLIGHT THIS ARTICLE. THEN PRINT THIS ARTICLE FOR YOURRECORDS TO HAVE THE NAMES OF THOSE YOU WILL BE SENDING $1.00 TO. NEXT, GO TO THE NEWSGROUPS AND PRESS "POST AN ARTICLE". A WINDOWWILL OPEN. TYPE YOUR HEADLINE IN THE SUBJECT AREA AND THEN CLICK INTHE LARGE WINDOW BELOW. PRESS "CRTL" AND THEN "V", AND THE ARTICLE WILLBE PLACED IN THE WINDOW. IF YOU WANT TO EDIT THE ARTICLE, DO SO, AND THEN HIGHLIGHT AND COPY IT AGAIN. NOW EVERY TIME YOU POST THE ARTICLE IN A NEWNEWSGROUP, ALL YOU HAVE TO DO IS REPEAT "CRTL" AND "V" AND PRESS POST.
7) That's it. Each time you do this, all you have to do is type in a different newsgroup, so that way, it posts to 200 different newsgroups. You see? Now you just have 199 to go!!! (Don't worry, eac hone takesabout 30 seconds; once you get used to it). REMEMBER ..200 IS THE MINIMUM. The more you post, the more money you'll make.AND THAT'S IT!!!! THOSE ARE THE ONLY 3 STEPS THERE ARE!!! You are now in the mail order business, and will start receiving $1.00 envelopes from various people, all over the world, within days.(HINT: THE MORE NEWSGROUPS YOU POST TO, THE MORE MONEY YOU WILLMAKE!). You may want to rent a PO Box, eventually, because of all the mail. If you wish to stay anonymous, you can come up with a name, suchas "manager" or"investor". Just make sure all the addresses are CORRECT, please! LET ME TELL YOU WHY THIS SYSTEMS WORKS!! Out of every 200 postings, let's say I ONLY receive 5 replies, (this is actually VERY LOW). So, I made $5.00 with my name at #5. Now then,each person who just sent me $1.00 makes, say, only 200 postings, now with your name at number 4, WHICH IS A TOTAL OF 1000 POSTINGS, not including yours too. 50 people send you $1.00 now; that's $50.00 you just made! Now then, your new 50 agents post 200 each with YOUR NAME AT NUMBER 3, or10,000 postings, (50 X 200). Average return is 500 at $1.00 each, which is $500.00! They make 200 postings, which is 5000 returns at $1.00 each,which is $5000.00!! And finally, 5000 people make 200 postings each,with YOUR NAME AT NUMBER 1. YOU NOW GET A RETURN OF $50,000.00 BEFOREYOUR NAME DROPS OFF THE LIST!! AND THAT'S IF EVERYONE MAKES ONLY 200 POSTINGS, AND IF ONLY A SMALL % PEOPLE RESPOND!!!When your name is no longer on the list, you just take the latest posting that is appearing in the newsgroups, and SEND OUT ANOTHER $5.00 to THE NAMES ON THE LIST, PUTTING YOUR NAME AT #5 AGAIN, AND START POSTING AGAIN!! The thing to remember is, do you realize that THOUSANDS OF PEOPLE ALL OVER THE WORLD ARE JOINING THE INTERNET AND ARE READING THESE ARTICLES EVERY DAY!! JUST LIKE YOU ARE RIGHT NOW!!! So, can you afford $5.00 and see if it really works? I think so.......People have said, "What if the plan is played out and no one sends you the money?" So what! What are the chances of that happening when there are TONS OF NEW, HONEST USERS AND NEW, HONEST PEOPLE joining theInternet and Newsgroups everyday? and, are willing to give it a try? Estimates are at 20,000 to 50,000 new users, each and every day!! Remember, play FAIRLY and HONESTLY and this WILL WORK, I PROMISE YOU!! You just have to behonest. Make sure you print this article out, RIGHT NOW, also, try to keep a list of everyone that sends you money, and always keep an eye on the newsgroups to make sure everyone is playing fairly. REMEMBER: HONESTY IS THE BEST POLICY!!

YOU DON'T NEED TO CHEAT THE BASIC IDEA TO MAKE MONEY! GOOD LUCK TO ALL, AND PLEASE, PLAY FAIRLY; YOU WILL REAP THE HUGE REWARDS FROM THIS.....WHICH IS TONS OF CASH!!! ****By the way, if you try to deceive people by posting the messages with your name on the list, and by not sending the money to the people already on the list, you will not get much. Someone I talked to knew someone who did that, and he only made $150.00; and that was after seven or eight weeks!! Then, he sent the 5 $1.00 bills; people addedhim to their lists, and in 4 - 5 weeks, he had over $10,000.00. THIS IS THE FAIREST, AND MOST HONEST, WAY I HAVE EVER SEEN TO SHARE THE WEALTH OF THE WORLD WITHOUT COSTING ANYTHING BUT OUR TIME! GOOD LUCK, AND HAVE FUN!!!!

4114. NEC C2221 transistor

Rocky, I appreciate the feedback.

Could you tell me about the AC RFI kit? I have contacted people at AC Delco, multiple GM dealers, and several GM factory referrals. Also contacted tech people at Borg Warner (BWD) and Standard Ignition (makers of aftermarket pumps). No one knows of a kit that is installed in the tank for GM cars (Ford does make available an in-tank RFI filter). Although a person in the group that prepares the GM cars for police fleets said that a harness for the Lumina that included a RFI filter (external to the tank) was available. The GM PN is 25027405. This may be adapted to other models with some modification.

I would really like to know about the AC RFI kit that you describe (Part Number etc.)

Hi Mark,

I was using MY experience of posting on this newsgroup as an example.
When my views were argued against on the subject of code-no code, I
never got the impression that any one of us were hating amateur radio.

As far as what you wrote, it was Burt who posted it and it was Burt
who I was responding to.

It sounds good, but will this really work? There are few
countries with mandatory band plans. The general trend is for
gov'ts to play a diminishing role in regulation. When band
conditions are crowded (for ex during ssb contests) some operators
ignore the voluntary band plans and trash the 'CW subbands'.

Jeff,

If they don't see CW as a filter why do they keep insisting that it is.
Read the posts, the CW filter myth is perhaps the number one claim,
when it gets debunked you can't just say, "We never said that." It is
right there in Dejanews time after time after time after time. I have
tuned down to the CW portions during contests; FU and FUOM were the
first groups I was able to copy over 20 WPM. Besides I don't want to
operate CW all the time so cleaning up the phone portions is of concern
to me.

[I still support a minimal CW requirement, perhaps 5wpm for all HF ham
[bands, with stiffer written tests for the higher licenses.

I can't even stand behind this "filter."

I would rather have a ham that I can hardly hear trying to pass emergency traffic than to have a would-have-been there with no radio at all because he was scared off by the code.

I'm a "Traditional" Tech -- when I got my license, you took 5WPM and the Novice test, then took the General written. The only thing keeping me from HF voice was the 13WPM code.

Since being licensed, I have run a couple of thousand hours of ES traffic -- fires, floods, slides, earthquakes, windstorms, snowstorms, plane crashes, searches, evacuations, you name it.

That included one of the first (the first?) uses of packet radio during an actual event (the Aeromexico crash, Cerritos CA 1986).

In 25 years, I have NEVER seen a situation where the code would have been any kind of advantage at all.

I HAVE seen several occasions where I wish I had had a 12-year-old with a dirt bike and an HT, but 12-year-olds say "I started working on my license, but that Morse Code stuff is so boring . . ."

I agree that it seem that on any given weekend you can find some sort of contest going on. I also think that due to the large amout of hams cramed into one small space this is bound to happen.

I would like to see us get more spectrum in the HF bands to be honest. Why can't we operate voice here in the US where the CW portion is on 40 meters? That's premo DX land down there. So much so it's tempting to bootleg if you caold make it work? Why can't operate voice there? Politics that why.

I agree there are too many people trying to do too many things at one time in the small segments we have.

I myself have a beef about "closed" systems. I for one see nothing wrong in people using that very freq. the closed repeater is on to communicate on direct all the time. It should be done.

Let me say this, if it's closed to membership only and anyone can join then that's cool. But to have it closed to only a few people is not a good idea.

Bubba

4129. HELP: VERTICAL ANTENNA & LIGHTNING!

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-21 00:00:00 UTC
From: wy491@freenet.victoria.bc.ca
Message-ID: <856539579.13873@dejanews.com>
Source record: 204086
Cross-posted to: rec.radio.shortwave,rec.radio.amateur.antenna,rec.radio.amateur.equipment,rec.radio.amateur.misc

Hello,

I would like to install a vertical antenna that I read about the other day, but have some concern about lightning danger.

The antenna is a vertical made from 1" diameter copper piping. The vertical portion will be about 16' and will be attached to either the roof or side of my house. The center conductor of RG-58 coax will connect to this copper pipe. The shield will be connected to a radial ground system made up of copper wire buried about 1 foot.

QUESTION:

How do I eliminate the danger of a lightning strike? I can't ground the copper pipe because the center conductor of the coax is connected. Naturally, I am concerned about damage to any electronic equipment connected to this antenna, but I am also concerned about actual physical damage to my house from a strike. I live in a coastal region, and we sure get our share of thunderstorm and lightning activity. There must be some way that this danger is handled, since so many vertical antennas are in daily use by SWLs and hams.

Ideas, anyone?

Thanks,

Rog

to make sure I hadn't missed anyone.

>: on to 30m. This is clearly the digital band. 70% of the signals copied
>
>Were these copied by a machine or heard by ear?

By machine. I couldn't hear a good number of them by ear. And of
course I had no hope of separating the skipnet packet signals by
ear. As I noted, I also took advantage of the DSP filters and tuning
indicator in the machine to locate OOK signals which were too weak
to copy by ear, so using the machine doesn't bias things one way or
the other. I was also listening to the speaker, so I was using the
by ear method in tandem. (After doing that for a while, it becomes
very clear how much you miss by ear compared to what the machine
can dig out. I should note too that the machine couldn't *copy* many
of the OOK signals, I've elaborated on why in other threads, but it
could *detect* their presence when the ear failed to do so.)

>
>You mentioned some digital modes were declining in use (packet and amtor for
>example.) Could you tell me which digital modes are popular now and
>if you expect them to remain popular for a long time?

PACTOR is definitely the most heard of the error controlled modes, followed by packet and RTTY. PACTOR is easily implemented, and works pretty well (especially if implemented with memory ARQ), so I expect it to retain a major position on HF for some time to come.

HF packet is an *abomination*. I hope that newer ways of doing packet on HF will quickly supercede the way we do it now. I don't have any inkling that such a hope will be rapidly fullfilled, however. The installed base is too large, and amateurs don't seem to generally realize just how bad it is. (There *are* better ways to do HF packet, but there is as yet no installed base for those ways.)

RTTY remains popular for a number of reasons. It is nostalgic. It is *very* simple to implement. And the digital DXer crowd likes it (probably for the challenge). I expect RTTY activity will be around for a long time. Of course it offers no error detection or correction at all, so performance is worse than the more modern methods.

AMTOR is dying quickly. PACTOR offers strong advanages over AMTOR while having no significant drawbacks compared to AMTOR. I expect AMTOR to become rare on the ham bands in the next few years.

Clover and PACTOR II offer strong advantages over the other methods. Clover usage has grown rapidly, and PACTOR II seems to be growing fairly rapidly too (more so in Europe I understand). PACTOR II is downwardly compatible with PACTOR, but that means it shares some of the deficits of the PACTOR protocol. It *is* very robust under weak signal conditions, but Clover is much more transparent to applications and is also a very robust protocol.

I don't know which of these will come to dominate, perhaps neither will, and something entirely different will displace them both. I've put my money on Clover, mainly because I can transparently operate network protocols on top of it (something which may not currently be all that important to other HF operators, but is to me), and because it is *good enough* for almost all HF conditions likely to be encountered, and because the hardware to do it adequately is significantly cheaper than for PACTOR II. For those not needing binary transparency and quasi-duplex capability, PACTOR II may offer a better way to do ordinary text transmission under very poor conditions.

>In the 20+ years that I've been on the air, I can find no evidence that
>CW usage has declined. Although I don't have any data from previous years,
>I get the feeling that the traditional 'CW sub-bands' are much more crowded
>than they were 20 years ago.

Well, there are a *lot* more amateurs today than 20 years ago. There is also a lot more SSB activity, and there is a huge difference in digital activity, most of the currently popular digital modes didn't even exist 20 years ago. You have to look at percentages to get a true picture of relative rises or declines in popularity. And of course the digital subbands are filling with more signals, so the OOK users are being crowded lower and lower in the

digital segments. That could offer the appearance of greater usage. I'd be very interested in seeing an age breakdown for the various modes. I have the impression (but no hard data) that OOK operators are on average older than the digital operators. There are certainly young OOK operators, and old digital operators, of course, but I think the averages would tend to favor the digital operators being younger. That portends a trend toward more digital operation and less OOK operation as time passes.

>: that SSB is the dominant mode on bands where it is allowed, but I was
>: slightly surprised that it showed no greater lead than it did on 20m.
>: Apparently that's a result of retiree bias due to the fact that I sampled
>: on a workday (and due to the growing use of digital methods, even among
>: the older set).
>
> This 'retiree bias' thing may warrant further investigation.

Indeed. Perhaps a good way to measure it is to compare relative activity in various modes on the weekend compared to during the week. The problem is that there seems to be a contest of some sort virtually every weekend, and that biases any count you could do.

>: The dominance of SSB on 75m at night was more in line with my expectations.
>: (I was gratified to see digital outstrip OOK Morse on 80m at night. That's a

>
>Thanks for your imformative post, Gary. My observations (informal, but
>quite numerous) suggest a 50/40/10% split amongst SSB/CW/other,
>where other includes digital, rtty, sstv, etc.

Your observations may be the result of depending on "by ear" technique. As I noted above, many of the signals I counted were below *my* threshold of "by ear" detection (at least until my attention was drawn to them by the tuning indicator, then if I concentrated hard I could sometimes hear something down there in the noise). But at least for the more robust digital modes, the signals were not below the threshold of solid copy for the machine.

Because of this good performance, many digital operators don't feel the necessity to use high power or large antenna arrays, so they often don't put in a signal potent enough to detect by ear unless you really strain. If you were just casually tuning the band, you'd probably totally miss more than half of them. And there's no way you can count the packet signals without machine aid. There are almost always *many* of them operating on the same frequency at (nearly) the same time thanks to

the TDMA technique used by packet. (Too often they are operating at *exactly* the same time, causing a collision, due to propagation induced hidden terminal problems, one of the defects of the current HF packet protocol.)

Gary

Jerry.

CW is not a filter it was started as a means for someone to get under the skin of the people that don't have CW behind them as a sort of "dig" to make you feel like a dumbass. It's not a filter it sort of like an oath of office. You have to take the oath to be in office. That's all. Anyone who can't learn that code should look into their local clubs for help. Anyone would be willing to help.

4132. Alinco DJ41S Re: 340mW on 440MHZ - How Far???

> >that's not powerful enough for an amplifier!

Since the Alinco DJ-41S's antenna is permanently attached, brick amps
aren't really an option anyway. This cutey is for either using your
mobile in cross-band repeat (but it doesn't have DTMF pad, so would be
at best a questionably legal control station) or working a nearby
regular repeater.

Note that 340mW is its HI power. It also has a 50mW LOW power mode,
there's a no-prize if you can figure it out without asking Alinco,
your salesman, or my web-page. (I asked Alinco.)

I bought it figuring it was better than no 440 rig at all.
It works fine with (nearly-) line-of-site repeaters that aren't
de-sensed by a nearer kilowatt pager. I even had a QSO from inside
my sister-in-law's aluminum-sided house. A nice radio for carrying
around the city or a hamfest, but not for in mobiles, driving Amps,
transverters, or whatever. (Well, maybe I could drive a transverter
with inductive coupling, they frequently want less than +25dBm anyway.)

My full review of this radio, and my elaboration of its instructions,
are at http://world.std.com/~wdr/alinco.html

Rog,

See the July 1996 Monitoring Times article called "Absolute lightning protection" by William A. Rhodes, an excellent article. This approach is worth pursuing and offers near-complete immunity from direct strikes on your antenna and equipment.

Happy listening!

Jon

Well, I'm alittle late on this thread, but after reading all these responses recommending "goo gone", hair spray, lighter fluid, I had to jump in.

The magic potion to use is peanut butter. Yes, I'm not kidding. Peanut butter works excellent at removing tape goo, tar, and that awful goo spot left when you remove a price tag from a book or magazine. Follow up by wiping clean or use alittle bit or soap and water (if its not a book or magazine). Peanut butter won't hurt you or the item your working on.

Before you laugh to hard, try it.

When I had a rooftop scanner antenna, I used to pick up cordless phones from all over the place. I used to hear dozens of signals. It's amazing how far a few milliwatts will go when you have a good receiver.

Getting back to his problem, maybe his best bet is to install an outdoor antenna. While it's illegal to modify the transmitter, it should not be illegal to modify the receiver. If he made a simple 1/4 wave antenna and got it away from the interference from his computer, then it should work well.

If his receiver is one of those poratble types with a telescoping whip, he could put an alligator clip on the end of the coax that leads to an external antenna. Heck, he could even put a length of, wire for an antenna, right outside the baby's window and run a length of coax back to his computer room! That should certainly cure the problem.

4139. Help with TS 820S Transceiver

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-21 00:00:00 UTC
From: Robert Redoutey <redoutey@bga.com>
Message-ID: <330DEAD8.605@bga.com>
Source record: 204096
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.misc

I have a problem with a Kenwood TS 820S Transceiver.

The digital display is off on each band.

160 1 khz
80 2.5 khz
40 5 khz
20 10 khz
15 10 khz
10 20 khz

This is apx freq off. I have the owners book and service manual, but not sure just where to find the fix. Probably just a cap is out of adjustment, but which one? I can adjust the "manual" knob to show the correct freq, but that defeats the purpose of the "digital" read out. Also I have noticed that its not just the display that is off, but something to do with the VFO, since tuning the VFO will not let me tune near the edge of the band. The tuning cap closes completely before I have hit the end of the band.

I have tried the fine tuning cap in the VFO can, but that gives me only a slight adjustment. Since it increases in freq, I think that it must be something with the base freq, and it muliplies as it goes up in freq.

The rig works great except for the display being off, and not being able to get to the lower edge of the band (bottom 10 khz or so).

Any and all information would be greatly appreciated. Please send info to the addresses below.

Thanks.

The best advice is to disconnect the coax from the equipment when the antenna is not in use. This goes for any antenna that is not at DC ground potential. Short the center pin of the PL-259 to the shield ring, and leave the coax on the shack floor, away from anything that is grounded. This will allow any static buildup on the vertical element to drain off to the grounded radial system. Yes, this could invite a strike, but my gut feeling is that the strike is going to happen either way, if there's a big enough charge in the air. If the lightning can jump 30 miles across the sky, it can certainly jump the 2" or so from the vertical element to ground.

I'm sure millions of folks will disagree. Flame me privately.

Are you going to use it just on 20 meters? If so, you can ground the
base and use a slant-wire shunt feed. Otherwise a spark-gap at the
base and a gas trap on your coax will help. I'd still ground the
whole thing when not using it.

Propagation Forecast Bulletin 8 ARLP008
From Tad Cook, KT7H
Seattle, WA February 21, 1997
To all radio amateurs

SB PROP ARL ARLP008
ARLP008 Propagation de KT7H

Solar activity continues low, with flux values still running lower on every day than the average for the previous 90 days, which dropped this week from 78 to 77. Geomagnetic indices rose on February 17 with estimated planetary K indices as high as five.

Low solar and geomagnetic activity is good news though for the 160 meter contest this weekend. Expect good conditions throughout the contest, with little threat of a geomagnetic upset. For the next few weeks conditions are expected to stay the same, with solar flux in the low to mid seventies.

The latest long term forecast shows the next solar cycle peaking just three years from now. This poses the question--why haven't we seen much activity yet from the new cycle? The projection is based upon previous cycles, and indicates an average sunspot number of 19 for January, and 22 for February, with the number doubling to 44 by July. It also shows solar flux of 77 for January, 80 for February, 84 for March, and 100 by July. Currently it appears that actual conditions are lagging these projections.

Sunspot Numbers for February 13 through 19 were 0, 0, 0, 0, 0, 13 and 15 with a mean of 4. 10.7 cm flux was 71.1, 71.3, 71.8, 72, 73.1, 72.9 and 72, with a mean of 72. Estimated planetary A indices for the same period were 4, 5, 4, 8, 17, 7, and 3, with a mean of 6.9.

Could somebody please post Burt Fisher's home address and telephone number on these newsgroups he keeps crossposting to so we can call him (like maybe when I'm reading the news at 2:00 A.M.) and tell him what we think of his abusive drivel and/or mail him dead rodents and such?

I read somewhere about some guy being a public pain in the ass and being subscribed to like 300 "bill me later" subscriptions to everything from porn magazines to Forbes. Surely somebody out there has a similarly wonderful idea about how to deal with Butt Fisher. If he wants to make himself a public figure, then we can treat him as such, you know posting details about his formerly private life, what kind of undergarments his wife wears, etc. I'd suggest to Butt Fisher that life as a private citizen is a little nicer than life as a public figure. I think a good argument can be made that his repeated controversial postings on USENET already make him a public figure. Thoughts?

Hi Mike,

My TS-850S/AT does the same thing, it did it new out of the box. Never seemed to hurt anything, and it is very slight, and has never increased in "play", so I never worried about it.

Take care and 73's,

Roger,

There have been quite a few postings here about lightening protection.
You can review them by using the dejanews.com search engine.

Keep in mind that you need to think about this problem in terms of AC vs
DC. Since the feedpoint is low-z, you could put a heavy duty RF choke
across the feedpoint. As long as it's Z at the operating frequency is
much larger than the feedpoint Z, it will not disturb the match. The RF
choke is hi-z at RF (AC), but low-z at DC. It won't provide total
protection, but it will definitely help and also drain off static
charges.

Some people could constantly mail bomb his account until his ISP cuts him off. Of course, he could switch to another ISP, and then the mail bombing might start again. However, I'm not recommending such a thing....

But..., its real easy to set up a cron jobs under unix to send it a huge 100k message every five minutes. If 50 people started doing that ... well, you get the pictures.

Uh, I do. See my web page. I haven't been an active ham for over 5 years. The quote that Burt used was part of an email between him and me where amongst other things we discussed why ham radio doesn't attract a large amount of youngsters. I explained that I WAS one of those young people (I was liscensed as WB1HJS at when I was 14. I failed the Novice exam, got mad, studied, and came into the hobby as a General) who lost interest early on. Due mostly to the political BS prevalent in the clubs. I've come and gone over the last 20 years, so I can safely say things don't change in ham radio. The "bug" bites every few years, and then when I check things out, it's like walking into a club after being out of the party scene for a few years. It's just exactly the same. The quote was about kids today. I told Burt that Ham Radio wasn't getting the kids because so many of them have much more interesting things to vie for their attention. With the advent of indoor climbing walls exploding across the country, which started in the early 80's, HUGE amounts of them are entering the sport, and absolutly blowing the old limits away. I can't even walk into my local gym without being inundated by rugrats. That's basically what the quote was about.

You seem to have unintentionally put my position as a code-nocode type
of thing. At least that's how it comes across here. Please know what
you are commenting on before doing so. I think I've explained what I
was talking about, but your above misinterpetation is a classic
example of what I was saying. If I were a young ham, I'd be damn
frustrated and maybe even pissed right now.

I've found that Bagpipe music is useful convincing neighbors with
bigger sound-systems to close their windows/patio doors.

With only 30W into a GE loudspeaker, mono, I got the 100W+/channel into
Cerwin-Vega's rock&roller to close his balcony slider...
Album was "Controversy of Pipers", a scottish bagpipe festival;
should still be available from Roundup Records.

Strangely enough, I have noticed these types of repeaters are the ones
that seem to be jammed repeatedly.

A sheer coincidence, I'm sure :-)

ROTFLL - yes, and since when was the resistor color code such a closely guarded secret among hobbyists?!!

I wonder what kind of royalties any of these dudes is collecting for writing these listings of the colors and the numbers that match up to them?!

Grin!

That is totally weird, the government just doesn't work THAT fast. It took 3 weeks for me to get my Radiotelephone first class plus radar back in the 70's.

Maybe the F.C.C. is finally taking their job seriously.

Certainly the newer digital modes are faster than the old Morse code, and some may actually be more effecient under weak signal conditions.

But the vast majority of ham HF rigs are used for single-sideband voice and do not have a multi-mode TNC & computer attached, just a microphone. When faced with with weak signal conditions, a marginal power source or a bad antenna, SSB voice transmissions may be uncopyable, but very often Morse code will still be readable.

Part of the intention of ham radio is to provide emergency communications: a functional telegraph key can be made from two wires and a clothespin, but good luck homebrewing a TNC and monitor from scratch, ESPECIALLY in an emergency.

I certainly hope emergency traffic nets use faster and better methods of traffic handling than CW, but the station ORIGINATING the emergency call probably will not have a TNC & computer, so I still support a minimal CW requirement. And CW has been used in recent emergencies.

I still support a minimal CW requirement, perhaps 5wpm for all HF ham bands, with stiffer written tests for the higher licenses.

<burtfisher@geocities.com> wrote:

>It takes guts to kiss ass?
>Thatr is what hams are experts at.

Burt,

You call yourself a teacher? A mentor entrusted to help shape the minds of our young children? Heaven forbid, a roll model? By your posts you have proven that you are incredibly opinionated, not above using foul language in an open forum of mutual learning that is easily accesable by curious young minds, you point your "holier-than-thou" finger at Amateur Radio Operators and seem to have no problem speaking ill-will of this group of human beings. Can you tell me just what exactly it is that makes you a better person than any of these people you speak so poorly of? I am an Amateur Radio Operator myself and I take great pride in it, I also pride myself on being a volunteer interpreter for the deaf, a volunteer for the American Legion, an advocate for the rights of Veterans and the disabled, among other similar interests. I literally volunteer more of my time than I work for a wage, I may be poor but if pride were gold I'm a very rich man.. Can you say that, Burt?

This is America, Burt, and you are by the first ammendment entitled to voice your opinion, but you already know that. I too am an American and am entitled to my opinions and my opinion is that you are a bigot and have no business in the teaching profession if you are incapable of treating other human beings as the equals that they are. In the mean time, I'll be praying for your students..

If you have such a problem with Hams, why not (on the way to church next Sunday) rip up your FCC license into little pieces and go about helping your fellow man in a manner more constructive than the one you have chosen.

John KB7VZL (and darn proud of it)

FOR IMMEDIATE RELEASE

Contact: Dave Larton N6JQJ (408) 778-7265
State ACS Training Officer (408) 778-3101 FAX
Telecommunications Branch larton@garlic.com email
Governor's Office of Emergency Services
State of California

NORTHERN CALIFORNIA EMERGENCY RESPONSE INSTITUTE COMES TO SACRAMENTO

You and your organization are cordially invited to participate in the Northern California Emergency Reponse Institute, May 17-18, 1997 in Sacramento, California. This year's Institute is once again being hosted at the Sacramento Municipal Utility District's Energy and Technology Center, and is sponsored by the Governor's Office of Emergency Service's Auxiliary Communications Service and the California Emergency Services Radio Association (CESRA).

Featured classes will include a debriefing on the recent 1997 Northern California flooding, a discussion on the many uses of technology in Emergency Services operations, using the Internet in Disaster Operations, Training the Trainer, working more efficiently with governmental agencies, and more.

Established in 1987, the Institute has trained hundreds of emergency communicators, coordinators and managers in the demands of emergency services during a critical incident. The Institute invites volunteers and paid-staff from all organizations and agencies having an interest in promoting better emergency services operations. Networking among and between attendees and agencies is encouraged, and a Saturday evening dinner discussion will highlight individual attendees concerns, problems and solutions.

To register, you may:

(a) Visit the ERI '97 Home Page at http://www.garlic.com/oes/eri/eri97.htm . You may download our registration form and mail or fax it back to us. The Web site displays the Emergency and Technology Center site, gives transportation information, lodging and restaurant recommendations, along with links that will allow you to enjoy all the sights and sounds that make our state's capital so perfect for visiting.

(b) Email us at larton@garlic.com for a registration information packet.

(c) Drop a note with your registration to:
ERI '97 P.O. Box 301 Fair Oaks, CA 95628

Seats tend to fill fast at the Institute, so get your $20.00 registration
in early so you don't miss out. Make out checks or money orders to ERI '97.

Questions? Contact Institute Director Dave Larton N6JQJ, at (408) 778-7265, by email at larton@garlic.com, or by fax at (408) 778-3101.

If this invitation is being sent to an organization, please give this message
the widest possible dissemination. Thanks! See you at Institute!

Correction ... to be competitive FOR SPECTRUM ALLOCATIONS today, you
need to use the spectrum in an efficient manner ... and to do that, "you
need
to know about computers, networks, speech compression, channel coding,
microwave technology, microcontrollers, digitial design, etc. etc.

> Certainly the newer digital modes are faster than the old Morse code, and
> some may actually be more effecient under weak signal conditions.

There's no doubt about either faster or more efficient ... it's simple
engineering
reality ...

> But the vast majority of ham HF rigs are used for single-sideband voice
> and do not have a multi-mode TNC & computer attached, just a microphone.

In the near future, new rigs will likely have (true) "data ready" computer
interface
ports ready for action ... the idea is to progress, grow, and improve our
capabilities,
NOT to remain stagnant in the 1950s ...

> When faced with with weak signal conditions, a marginal power source or a
> bad antenna, SSB voice transmissions may be uncopyable, but very often
> Morse code will still be readable.

Most emergency communications are conducted between a multiplicity of
stations
that have reasonable S/N ratios ... in fact, most emergency communications
these
days are carried out using FM (1), packet (2), and HF-SSB (3) ...

vanishingly small
amounts of traffic of ANY importance is passed using OOK Morse ...

> Part of the intention of ham radio is to provide emergency
communications:
> a functional telegraph key can be made from two wires and a clothespin,
> but good luck homebrewing a TNC and monitor from scratch, ESPECIALLY in
an
> emergency.

See above ... the reality of valuable emergency communcations capabilities
are
preparedness, efficiency, and availability ... the "whip it up from scraps
at the time
of need" stuff is wishfull-thinking crap that pro-coders keep trying to
pass of as
plausible ...

> I certainly hope emergency traffic nets use faster and better methods of
> traffic handling than CW, but the station ORIGINATING the emergency call
> probably will not have a TNC & computer, so I still support a minimal CW
> requirement.

Why do you assert that the originating station "probably won't have a TNC
and
computer" ??? On what basis?

> And CW has been used in recent emergencies.

Name one ... for each one you can name in the past 10 years, there are
dozens
... probably hundreds of instances where FM, packet, or SSB where used.

> I still support a minimal CW requirement, perhaps 5wpm for all HF ham
> bands, with stiffer written tests for the higher licenses.

I said last week that I'd accept the proposal that was forwarded for an
across
the board 5 wpm for all current classes (Extra theory + 5 wpm = Extra
privs,
except, perhaps in the "extra CW subband") ... as an interim measure until
the ITU treaty could be ammended to eliminate all CW *testing*
requirements.

> snowstorms, plane crashes, searches, evacuations, you name it.
>
> That included one of the first (the first?) uses of packet radio
> during an actual event (the Aeromexico crash, Cerritos CA 1986).

You likely digipeated through my home station in the Fullerton hills during
that
incident ... much of the traffic to the OES command post station at Los
Alimitos
Naval Air Station did since I had about 600' of altitude and a good view to
both the
crash site and the command post ... our club (Sierra Peak Amateur Radio
Club)
repeater on 440 was also heavily used (one of my fellow board members Don,
WB6UCK was Director of Comms for OES in SoCal at the time) ...

> In 25 years, I have NEVER seen a situation where the code would have
> been any kind of advantage at all.

Me neither, and I've put in about the same amount of time at fire camps,
Red Cross shelters, and as NCS as you seem to have ... (BTW ... you
didn't seem to mention your callsign ... I don't recognize the name, but
it's
been a few years ...)

It seems to me that most of the pro-coders are Walter Mittys ... dreaming
about how they'll "save the day" ... while the Tech Pluses (and more
recently code-free Techs) are the ones who do the bulk of the actual
emergency comms ... since most is VHF/UHF FM and packet now ...

>I copied the following from the FCC FTP site. ...
> "As of Thursday, 2/20/97, the date of birth found in the appl file

Today, the AA-NOTE says:

"21 February, 1997
THE DATE OF BIRTH FIELD WILL BE RETAINED AND WILL BE NULL.
Sorry for the inconvenience.
Mike"

At least the NULL saves us all from changing our import routines.

Thanks for the tip; I hadn't seen this coming. I will probably switch
back to using the FTP site via NORTON instead of using notscrape, as
the AA-NOTEs don't get into the index.html file.

If you want ANY licensed amateur's address and phone number, do a search for QRZ on the web. Once there, you can input the callsign, and instantly get the info you want. Beware, that sometimes weird people use others' callsigns. Please be careful not to flame an innocent bystander in the process.

Good luck, and please think before you act harshly. The net is fun, and some people just are 'that way'.

Kentucky has a scanner law, but it was also the last state with a
scanner law to grant an exemption status to hams. I'd check with
your local police or a library to obtain the latest statute. The
prior law was KY ST 432.570

WICEN NEWS

A new addition to the WICEN calendar is the Colo 24-Hour Horse Enduro,
to be held on 12th July; the contact is Alan VK2YYJ.

Next month sees the Central Coast meeting, on the 14th March, and the
Hunter meeting, on the 17th March; the latter meeting will feature a talk by
Telstra. There is the Wyangala Triathlon, in the Orange area, to be held on
Sunday 16th March; enquiries are directed towards Peter VK2ETK or
Adam VK2XRA. Following this is the VRA Mid Year Conference, at

Wombeyan Caves, on the weekend of 22nd-23rd March.

On 13th April is the Forster Triathlon. This is an all-day event, early morning to late evening, and about 25 operators are required for this event; food, drink, fuel and T-shirt are provided. Operators will need to bring equipment for 2m and 70cm voice, and will also need to contact Richard VK2CHC for further details. Following this is the Watagan Mountains Car Rally, over the weekend of 19-20th April, for which Andy VK2XRX is the contact; around 20 people are required for this exercise. Later on is the Hawkesbury Emergency Expo, run by Alan VK2YYJ, over 16th-18th May; the Colo 24-hour Horse Enduro on 12th July, also run by Alan, and the Oberon Car Rally, also also run by Alan, on the 11th October; the Hawkesbury Classic Paddle is organised by Kevin VK2CKD over 18th-19th October and the annual Bungonia Cave Rescue will be on the weekend following, over 25th-26th October.

WICEN is always looking for members to provide the community with communications assistance. Write to WICEN (NSW) Inc, PO Box 123, St Leonards 2065 for further information, or come up on one of the WICEN nets: Northern Rivers each Tuesday at 8pm around 3610 kHz on odd Tuesdays and the Lismore repeater 6800 on even Tuesdays, Hunter each Wednesday at 7.30pm on the Newcastle repeater 6900, and Central Coast each Thursday at 8.30pm on the Wyong repeater 7125. If there are any other regular nets then we'd like to hear about them.

WICEN (NSW) has a Web page, and the Uniform Resource Locator is: "http://www.nsw.wicen.org.au/". It is generously provided by the Macquarie University School of Mathematics Physics Computing and Electronics, and contains pointers to many emergency-related pages likely to be of interest.

-- Dave Horsfall VK2KFU, WICEN (NSW) Inc. Publicity Officer

MINISTER SENDS WIA SUBMISSION TO DEPARTMENT

The Minister for Communications and the Arts, Senator Richard Alston has sent the WIA's submission on amateur licensing to his Department, to be considered in a review of the Radiocommunications Act and amendments which will be conducted by the Department this year.

A delegation from the WIA met with the Minister at Parliament House in Canberra on Wednesday, 12 February. The delegation comprised Federal President Neil Penfold VK6NE, the WIA's representative on the Radiocommunications Consultative Council, David Wardlaw VK3ADW, and the submission's author-editor, Roger Harrison VK2ZRH.

The Minister asked many questions about amateur radio and amateurs' activities. The main thrust of the Institute's submission was outlined, that the present three licensing systems under the Radiocommunications Act were drafted to suit public and private sector commercial purposes and for that reason, they do not suit the voluntary, non-pecuniary nature of the Amateur Service and radio amateurs' activities. The basic proposal of creating a separate licensing system under the Act was put forward.

In answering the Minister's questions, the topics covered by the delegation included:

amateur radio encourages young people to take up an interest in science and technology, leading to careers in science and engineering (presently an important concern of the government);

amateur radio involves self-training in radiocommunications and related technologies and techniques;

amateurs must be qualified through a system of examination;
amateur radio is an international hobby, recognised by the ITU under international treaties and regulations;

amateur radio promotes international goodwill and understanding;

amateur radio provides a regulated, yet self-regulating, outlet for people interested in transmitting, hence providing orderly use of the spectrum where otherwise there might be anarchy with clandestine stations;

radio amateurs' activities provide value to the community through contributing to the advancement of science, the development of technology and support during community disasters and emergencies;

that the WIA actively participates in spectrum management processes both locally and internationally, and that the Institute had provided - at our own cost - people to act on behalf of Australia on delegations to international regulatory conferences;

The Minister's Liaison Officer present during the meeting, later said that the WIA's presentation of the submission was very timely.

The final draft of the submission was completed on 20th January and circulated to all Divisions that week. Following suggestions from some Divisions and discussions with David Wardlaw and Neil Penfold, a small amount of further information was included and minor amendments made.

The Federal Council was to consider publication of the completed submission at the Extraordinary Convention being held over 15-16 February (originally scheduled for 8-9 January, as advised in January Amateur Radio magazine, but postponed by the Federal Council in January so that all Federal Councillors could be present).

The 33-page submission of five sections, with 28 pages in four appendixes, includes a 4-page Executive Summary. This sets out that radio amateurs require:

individual licences,

certainty of licence tenure,

where fees are applicable, an equitable fees framework,

certain and continuing access to frequency bands throughout the radiofrequency spectrum, and

continuing participation in spectrum management processes at local, national and international levels.

The Executive Summary also outlines the WIA's arguments that the current three licensing systems have conflicting limitations, restrictions and administrative constraints for the Amateur Service. That the fees framework for the Apparatus Licence system embodies concepts which are of a commercial, economic nature not applicable to the Amateur Service. All this leads up to the proposal to create a fourth licence type, specifically for radio amateurs which would recognise and provide for the complete flexibility needed to pursue our activities, within the framework of allocated amateur bands and applicable licence conditions.

The submission specifically asks for recognition of the unique nature and status of the Amateur Service and proposes arrangements which would simplify government administration and reduce amateurs' 'engagement' with the authorities through devolvement, citing the existing devolvement of examinations.

The submission argues that it would be open for the government to waive fees in recognition of the value the Amateur Service provides to the community, as has the US government. A copy of the joint resolution of the US Congress and Senate was included in an appendix. The submission also gives recognition to the fact that there is a necessary departmental cost in essential spectrum management and regulatory process, at national and international levels.

Development and presentation of the submission was only the first step in the process. The Minister's office has confirmed that there will be an opportunity to further argue our case and put additional material forward when the Department of Communications and the Arts conducts the review of the Radiocommunications acts and amendments later this year.

The WIA Federal Council is to consider further action in advancing the case for a licensing system for amateurs.

WIA Federal President, Neil Penfold VK6NE has added the following comments:

OPENING A DOOR TO THE FUTURE

On the 12th of February, three of us from the Federal body - David Wardlaw VK3ADW, Roger Harrison VK2ZRH, and myself - took the WIA's submission on amateur licensing to the Minister for Communications and the Arts, Senator Richard Alston.

The Senator gave us a very good hearing, of about 35 minutes. He asked us a lot of questions about amateur radio and learned, as much as could be put across in the limited time, about the broad range of activities amateurs are involved in, the background to our hobby and why we need a licensing system of our own. Through his questions, he learned we have bands spread through the radio spectrum and that amateurs are not assigned individual frequencies, of the value amateur radio provides to the community, that it is an international hobby involving self-training, that

amateurs are individually licensed and recognised internationally by the ITU and countries around the world. The question and answer session also covered satellites, communications support for emergencies, call signs and the examination system - Senator Alston did not realise amateurs had to be qualified.

He told his Liaison Officer present at the meeting that the submission was to go to the Department of Communication and the Arts. The Minister's Department will be conducting a review of the Radiocommunications Act and amendments this year. As the Radiocommunications Amendment Acts had their first readings in Parliament early in December, I contacted the Minister that month to seek a meeting so that the Institute would not miss a timely opportunity to present the case for a better amateur licensing system. The Minister set the date. So, the presentation of the submission was very timely, as confirmed by the Minister's Liaison Officer.

Developing the submission has been a lengthy process. There are those that say it has taken too long. But really, "quick fixes" so often turn out to create more problems than they solve. They leave difficulties for "someone else" to tackle, later. We're trying to get something better for the future. Something that will last. Not something that just suits impatient amateurs now.

The process began with the Federal Council agreeing on a 'framework', outlining the issues to be covered and leading to a proposal. This was agreed in mid-1995. Getting this framework required research of what the Federal Council had discussed and established in the past. A first draft was circulated to Federal Councillors in February 1996. From discussions and suggestions coming from that effort, the Exposure Draft was completed which the Federal Council agreed would be sent to candidates for the March 1996 federal government election. It was also published in AR and on the Internet. As a result of that, when Senator Alston became Minister for Communications and the Arts, he invited the WIA to present the final submission once the process of amateur community consultation had been completed. The final draft of the submission was circulated to Divisions in January and I was pleased to see general agreement return from Divisions shortly before we met with the Minister.

We did not expect to 'haggle' over details or terms with the Minister. Being able to meet the Minister and establish formal contact, and having the submission sent to the Department of Communications to be considered in the coming review of the Act and amendments is a considerable achievement of which the Institute can be justifiably proud. When that review comes around, we will have further opportunity to advocate our case.

For now, the door to the future for amateur radio has been opened.

-- Roger Harrison VK2ZRH, Federal Media Liaison Officer

DX NEWS

KUWAIT, 9K. - Amateurs in Kuwait will celebrate the National and Liberation Days by signing homecalls "/NLD" from Tuesday through Friday

this coming week. The Club station 9K2RA will also be active.

NEPAL - Rich 9N1RHM is currently active on CW and RTTY on most HF bands.

TAIWAN- Chung BV4ME and Leo BV7FC, have been active on 160 meters. Chung has been found often on 1828 kHz around 2000 to 2230z.

CANARY ISLANDS - Several Spanish Amateurs will be operating as EA8ZS in the CQ WW DX 160 Meter Phone Contest this weekend.

ARMENIA - EK6GC is currently active on 160 meter SSB, and will also be active in the CQ WW 160 Meter Phone Contest.

DJIBOUTI - Dominique F5RYC will soon be active as J28YC.

WAKE ISLAND - KC7FWZ/KH9 has been active on 10107 kHz at 0810 UTC. The length of his stay, and his QSL route, are unknown at this time.

BELIZE - Members of the Cuba Libre Contest Club will be active on all HF banmds as V31DX during the ARRL DX Phone Contest on 1st-2nd March.

CHATHAM ISLANDS - Lothar DJ4ZB, will be active as ZL7ZB until March 13. He works SSB only on 80 through 6 meters.

Finally, if you hear KG4AA and KG4US on the bands, it might be best to avoid them, according to the ARRL DX bulletin, they are pirates. These calls have not as yet been issued.

--extracted from the ARRL DX bulletin No. 10, dated 20 February, 1997

Speaking of questionable callsigns, here's one that ISN'T. The Spectrum Management Agency has advised the WIA that the call sign VM4AAA, often heard on the 14 MHz band, is an authentic call sign, held by a Queensland amateur.

The SMA said that the call sign was awarded to the holder in 1983 by the then Minister for Communications, the Hon. Michael Duffy, 'in recognition of extended participation in the Amateur Service.'

A proposal at the time to award VM prefixes to amateurs who had been licensed for 50 years or more was not implemented.

Call sign VM4AAA "remains allocated as a special case," the SMA said, and they "will not consider the issue of any further call signs that do not conform to the current amateur call sign template."

--Roger Harrison VK2ZRH, Federal Media Liaison Officer

CLUB NEWS

CHIFLEY AMATURE RADIO CLUB

The club meets every Saturday at 1:30 PM.

The address is, The Good Shepherd Church at Hyatts Road Plumpton.
Members, guests, visitors are all welcome.

You can call on the club repeater on 147.075 if you cannot find us.
The club holds a 2 meter net on the club repeater at 8:00 every Friday night
all checkins are welcome.

The Club conducts classes, to obtain an amateur licence, on Monday
nights, at 7:00. For info ring (02) 9837 2226 or (02) 9834 1186.
CW Clases Start on the 27 FEB.

Coming events, A club meeting on Saturday 22.Feb.97

ORANGE & DISTRICT AMATEUR RADIO CLUB

Another reminder from The Orange Club about their "Wyangala 1997" two
metre communications exercise of Sunday 16th March. Operators are
definitely still needed, with the exercise only three weeks away - and many
thanks to those who have already replied. We need a total of 32 or more
operators, so if you're thinking about it, please get onto Peter VK2ETK on
063 61 3439 or Adam VK2XRA on 063 61 2264 before you forget.

[For the Saturday evening broadcast only]
The Orange club will also have some people at the Central Coast Field Day
at Wyong tomorrow, so you may obtain details and registration forms
there). Those phone numbers again: 063 61 3439 and 063 61 2264, and
you can add an lnternet e-mail address too: aroberts@ix.net.au and also a
fax number: 063 62 2782

--From Peter VK2ETK of the Orange and District Amateur Radio Club

HORNSBY & DISTRICT ARC.

The formal monthly meeting, is on Tuesday, 25th February, 1997. At 8:00
pm. In the Mount Colah Community Centre, Pierre Close, Mount Colah.
(Located near the Eastern Entrance to the Railway Station.) After the
business is taken care of, there will be a lecture, the subject being the
lnternet, the lecture is by Dave VK2KFU. Visitors are most welcome.
Training classes, are held each Thursday, evening at 7:15 pm., in a hall at
the corner, of Palmerston Rd. & Burdett St., opposite the Hornsby Hospital.
(The nearest railway station is Waitara.) The class has nearly, reached
the cut off point, so if you would like to enroll, do so now. For more
information phone, Tony VK2BTL on 9487 3383.

The Club conducts, a net every Monday night, at 8:00pm. on VK2RNS.
The frequency is 147.250 with a positive offset. Feel free to join in. All are
wellcome. Listeners set your scanner to 147.250.

Should you wish to know more about the Club, or its activities, please write
to:- H.A.D.A.R.C. at Post Box 362, Hornsby, 2077. or contactthe Publicity
Officer, John on 9807 2490.

If you would like to submit a news item for inclusion in the weekly
broadcast, please send it to us by one of the following means:

by post to the Divisional Office, PO Box 1066, Parramatta NSW 2124;
by fax to (02) 9633-1525;
by packet radio to BCAST@VK2WI.NSW.AUS.OC, or
by Internet e-mail to wiansw@sydney.dialix.oz.au

Please note that the deadline for news items is 2pm on the Friday
preceding the broadcast; if submitting news items by packet or internet,
please allow for forwarding delays in the network.

If submitting printed copy, please:
submit your news item on A4-size paper;

double space your text;
write on one side of the paper only, and
use a plain font such as "Arial" or "Helvetica", 12-point or larger. This is
especially important if sending your news item by fax.

Please avoid using abbreviations and shorthand, check your spelling,
grammar, and punctuation, and use the exact words you wish the
announcer to say on-air. Remember, the more care you take in preparing
your news item, the better the announcer will read it.

Interesting point....just what other countries besides
the USA have government established subbands as
found in the USA? If none or almost none, then it seems
all the hew and cry about encroachment on CW subbands
is truly off the mark as there aren't any true CW (actually I
should say non-phone) anywhere else.

-
Here is a summary of news items covered on edition #204 of
"This Week in Amateur Radio", North America's satellite-delivered
audio bulletin service, for the week ending 28-Feb:
-
1. ARRL Reports Growth in Amateur Radio During 1996
2. Birth Date Information Dropped from FCC License Database
3. FCC Initiates New "888" Consumer Information Hotline
4. ITU to Oversee Use of New Overseas "800" +8 Numbers
5. IARU High Speed Telegraphy Contest Scheduled for Bulgaria
6. HAARP to Run HF Tests Next Month, Will Offer QSL Card
7. Web Site Adds "This Week" Program File in "RealAudio" Format
8. Section Manager Election Results Announced by the League
9. Weekly Propagation Forecast
10. "Gateway 160 Meter Net Report" with Vern Jackson, WA0RCR
11. New Computers Needed for Production of "This Week"
12. "The RAIN Dial-up" from Chicago
13. "This Week" Seeking Special Feature Producers/Commentators
14. Appearance of Maryland Ham on "Prime Time Live" Delayed by ABC
15. Special Event Station Calendar
16. TV Station Web Site Offers Antenna/Lightning Safety Tips
17. "Tower Safety" - Second in a Series by Greg Stoddard, KF9MP
-
Funding for the program's transmission and production expense was
provided this week by a grant from the Stoddard Family and users of
the N9SBH repeater, in North Webster, Indiana, where "This Week in
Amateur Radio" is heard on 224.16 MHz and on 147.445 MHz simplex,
serving North Webster, Goshen, Warsaw, Plymouth, and Syracuse.
Presentation of "The RAIN Dial-up" has been made possible by a
grant from Bruce Bjorklund, WR0P, of Cambridge, Minnesota.
-
"This Week in Amateur Radio" is a weekly amateur voice bulletin
service, produced by Community Video Associates, Inc., a New York
State not-for-profit corporation based in Albany, NY. The program
is heard on the "W0KIE Satellite Network" each Saturday at 9:00 PM
(EST) on the Hughes Communications SBS-6 commercial communications
satellite, transponder 13B upper, located at 74 degrees west
longitude in equatorial geosynchronous orbit. The transponder
center frequency is 12.019 GHz; tune up in frequency to 12.031 GHz.
```

Program audio is on the 6.2 MHz analog subcarrier. On the Internet, audio is available each Sunday in 8-bit .WAV file format, sampled at 11.025 kHz, at http://www.intrlink.com/~sparky/wb4qoj/wb4qoj.htm through the courtesy of the Blue Ridge Video and Digital Society of Roanoke, VA. A separate "RealAudio" file is also available at this site. The service is carried on VHF/UHF repeaters throughout North America and on 160 meters at 1860 kHz. Contact your local amateur radio club or repeater operator if "This Week in Amateur Radio" is not being heard in your area.

-

Production and transmission expenses are underwritten by donations from repeater operators, amateur radio clubs, and individuals. Further information is available from George Bowen, N2LQS, at 518/283-3665 (email kxkvi@delphi.com) or Stephan Anderman, WA3RKB, at 518/664-6809 (email sanderman@delphi.com). You may also reach them @ WA2UMX.FN32AW.ENY.NY.USA.NA via amateur packet.

> at all because he was scared off by the code.

And were I a diaster victim, I'd rather the radio op handling ermergency traffic be capable of resorting to a primitive but effective digital mode (CW), should SSB or FM fail.

> Since being licensed, I have run a couple of thousand hours of ES
> traffic -- fires, floods, slides, earthquakes, windstorms,
> snowstorms, plane crashes, searches, evacuations, you name it.

No sarcasm: Keith, thanks very much for your public service.

But how many of these emergencies were handled on VHF repeaters? Most small local emergencies can be easily handled with existing VHF FM voice or digital FM repeaters. _BUT_ in the event of a major catastrophe, your FM voice and digital repeater networks may be destroyed, and a single HF SSB/CW rig will be vital in contacting the outside world.

HF conditions are considerably more variable than VHF. With marginal HF propagation or a low power rig, or a damaged antenna, communication with CW is often possible when SSB voice comms are unreadable. PACTOR and CLOVER are supposed to be fantastic under weak-signal HF conditions, _BUT_ most HF rigs don't have a multi-mode TNC and monitor attached. A simple CW key can always be jury-rigged, IF the operator has a little CW fluency.

> In 25 years, I have NEVER seen a situation where the code would have
> been any kind of advantage at all.

And I've been trained in CPR for about 20 years now, but have never had a chance to use it. Therefore, is CPR training not valid??

CW has been used recently in HF emergency traffic. I'd like to see a 5wpm CW level for all of ham HF: being able to copy 20+ wpm may only mean that the op is a compulsive, masochistic sort who wants to send CQ CQ TEST all week-end long.

> I HAVE seen several occasions where I wish I had had a 12-year-old
> with a dirt bike and an HT, but 12-year-olds say "I started working
> on my license, but that Morse Code stuff is so boring . . ."

Uh, have you heard of the Codeless Tech license?! That 12 year-old can now use a VHF or UHF HT without knowing CW. But should that 12 year-old get interested in HF, I hope there will always be a minimal CW requirement.

Owens Lake Radio DX and Astronomy Expedition
Brian Webb, KD6NRP
102670.1206@compuserve.com

On Saturday, March 1st, I plan to take a trip to the eastern side of Owens Lake to perform experiments with very long wire antennas, photograph artificial earth satellites, and observe faint astronomical objects.

My plan for next Saturday is as follows:

07:00 Check weather forecast for Owens Lake. If good, begin packing
08:00 Depart Thousand Oaks
13:30 Arrive at east side of Owens Lake
13:30-14:00 Locate suitable site
14:00-14:30 Deploy either two 1200 ft or one 2400 ft long wire antenna
14:30-15:15 LF and MF reception experiments
15:30 Rendevous with latecomers at the intersection of routes 136 and 190
16:00-18:00 LF and MF reception experiments
18:30-19:45 Photograph artificial earth satellites
19:45-????? Astronomical observing

I'm looking for others who may want to drive up to the site with me or meet me there. I'd be leaving the Thousand Oaks area at about 08:00 and arrive in the vicinity of the site at about 13:30. After a few hours of photographing satellites and deep sky observing, I'd pack up and head for home (I might consider getting a hotel room and staying until Sunday morning).

If you're interested in joining me, contact me at my e-mail address.

Owens Lake Radio DX and Astronomy Expedition
Brian Webb, KD6NRP
102670.1206@compuserve.com

On Saturday, March 1st, I plan to take a trip to the eastern side of Owens Lake to perform experiments with very long wire antennas, photograph artificial earth satellites, and observe faint astronomical objects.

My plan for next Saturday is as follows:

07:00 Check weather forecast for Owens Lake. If good, begin packing
08:00 Depart Thousand Oaks
13:30 Arrive at east side of Owens Lake
13:30-14:00 Locate suitable site
14:00-14:30 Deploy either two 1200 ft or one 2400 ft long wire antenna
14:30-15:15 LF and MF reception experiments
15:30 Rendevous with latecomers at the intersection of routes 136 and 190
16:00-18:00 LF and MF reception experiments
18:30-19:45 Photograph artificial earth satellites
19:45-????? Astronomical observing

I'm looking for others who may want to drive up to the site with me or meet me there. I'd be leaving the Thousand Oaks area at about 08:00 and arrive in the vicinity of the site at about 13:30. After a few hours of photographing satellites and deep sky observing, I'd pack up and head for home (I might consider getting a hotel room and staying until Sunday morning).

If you're interested in joining me, contact me at my e-mail address.

Dana...

The reason why I did bring this up is because of the fact, that anytime a radio is modified to cover a range of frequencies other than those it was specifically designed to do in both it's receiver and transmitter chains, performance of ALL filters are degraded.

Unless extensive modifications are made to those chains, it's likely that the signal transmitted will lack the spectral purity the radios which are designed for the service would have. As for the receivers? They too would usually would suffer some performance characteristics as well.

Again - it is poor engineering practice to do this.

Try WD40. I have used it on lots of plastic and glass to remove tags.
Saturate the tag, and let it soak in.

SNIP!

I completely agree. There was a time when the Morse Code requirement had a rational basis. It no longer does. The HF bands sound like a geriatric ward. The hobby is dying because the code requirement is filtering out new blood. Young people are willing to work to enter a neat hobby like ours, but for the most part they aren't willing to spend a lot of time learning something that is valueless. And whether we like it or not, that is how they view Morse Code. As do I.

4207. * Update: Windows Logging/Packet Freeware

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-22 00:00:00 UTC
From: M.McAmis@Valley.Net
Message-ID: <5en0np$5aq$5@dartvax.dartmouth.edu>
Source record: 204018

Disappointed with your commercial/shareware logging or
packet software for Windows? Try XMLog, freeware that's
available on the Internet. XMLog provides a flexible
set of coordinated logging and packet features.

XMLog is available on my home page:

http://franklin.ptgi.com

A new version (1.26) is now available and includes
these new features:

- Default values can be defined for any log field.
When these defaults are enabled, they will be
applied to new log entries.

- If you double-click on a frequency displayed in the
packet window, XMLog can set your rig to that
frequency (and set the appropriate mode). So far
I support Kenwood, Icom, and TenTec rigs and a few
Yaesu rigs.

- Vocal announcements for PacketCluster spots in
addition to the current CW spots.

*** Feedback ***

Let me know if you:
- Want more info
- Can't fetch the file
- Want a diskette instead

Have fun...

According to Carl Stevenson, unless you own an electronics repair house
and sit around all day "inventing" new radio stuff, you're not a 'real ham'.
You're just a yacker, beeper, or CBer (and multiple combinations thereof).

Nope, sorry Burt but I am not an ARRL type person. Those of us that work
with the young folks here show them **REAL*** ham radio and not the tripe
that is spouted by some on the news groups or on the HF bands in certain
places. But then I doubt that you would do any differant to lure the
young in as your posts show that you really only do the motions of trying
not put any heart into it. It is plain to see that your love is in the
commercial area. Yup, I was in the commercial area too, I guess if you
call being a chief engineer for a couple of radio stations commercial.
But that is a differant story....And only has enhanced my abilities and
enjoyment of ham radio.

enuff said. end of thread.

Fred Ke8tq

I may not always agree with what you say. But I will defend to the
death your right to say it.

Laws differ in different parts of the world. In the UK possession of an amateur tranceiver is legal whether the owner has an amateur license or not. Totally legal. In fact you can buy them over the counter with no questions asked. Using it is a different question.

The right of free speech comes as a bundle with the responsibility of free speech. Since you demonstrate little responsibility yourself it would appear that packet sysops are forced to take responsibility. The pity is that now you will have your electronic tantrums on the news groups. Perhaps if all of those on the news groups who were tired of your spamming were to flood your provider with complaints your provider would take the same action as the packet sysops. Then you could scream your complaints out on the beach.

To answer your as yet unasked question, Yes I would say the above to your face, I just would not fly across the country to do it.

Not long after they realized that they could use the extra space for AM
stereo and for "subscription elevator music" stations.

What can make the FCC move much better than prune juice can? I'll give
you a little hint...

M-O-N-E-Y!

I think it was Gene Scott during one of his saner moments who said:

"The Federal Communications Commission: Where blatant bribery of government
officials runs rampant, but nobody in government seems to give a damn."

> Is this frequency limit only in the US or is it also recognized in Canada?

The US and Canadian governments are each totally sovereign, autonomous
and independant of each other. And why not? They ARE two seperate nations.

few months ago./

If you're going to use your vhf/uhf rig out of band, e.g. in the marine
band,
have a marine license, even though it isn't type accepted, who's going to
ask which radio you're operating. SAme for gmrs, or other services. If
youy're licensed to use the service, even though your radio isn't type
accepted, you can operate out of band and get away with it. It's kind of
a "DOn't ask, don't tell thing."

4220. Expanded Distribution for the WR-3E VLF "Natural Radio" Receiver

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-22 00:00:00 UTC
From: scollin@sapphire.win-uk.net
Message-ID: <907@sapphire.win-uk.net>
Source record: 204031

Stephen P. McGreevy's VLF "Natural Radio" receiver, the WR-3E, is
now distributed outside North America by Simon Collings, Radio
Communications Consultant

Welcome to the realm of extreme and very-low-frequency (ELF/VLF)
"Natural Radio!" phenomena in which you will be able to hear
naturally occurring radio frequency emissions from the Earth's upper
atmosphere using a simple hand-held receiver. The WR-3E is an
electric-field "whistler receiver" specifically designed to monitor
the Earth's naturally-occurring emissions in the 0.1-11 kHz part of
the ELF/VLF radio spectrum. The receiver uses a short 33-inch/84 cm
telescoping whip antenna to pick up the emissions - no large wire
antennas are required. All you need in addition to the WR-3E is a
9V PP9 battery and a pair of headphones to hear a variety of
exciting natural phenomena. I am pleased to announce that the WR-3E
is now available outside North America exclusively from Simon
Collings, Radio Communications Consultant.

If you are outside North America, contact:

Simon Collings, Radio Communications Consultant, 46 St. Michaels
Road, Cheltenham, Gloucestershire, GL51 5RR, ENGLAND
E-mail: scollin@sapphire.win-uk.net.
Website: http://www.sapphire.win-uk.net/prod08.htm

If you are in North America (including Canada), contact:

4224. 3894.5Khz...Hear THE ZOO via THE NET!

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-22 00:00:00 UTC
From: mnmaniac@aol.com
Message-ID: <19970222203400.PAA22072@ladder02.news.aol.com>
Source record: 204035

Yes! Through the magic of the Internet and FTP, I am now proud to offer you...the distinguished readers and participants of rec.radio.amateur.misc...the opportunity to download five newly created and digitally mastered sound files! Hear for yourself why I affectionately refer to 3894-dot-5 as "The Zoo of Amateur Radio." Just listen to what you get:

1) BIG-AL-SAT-NITE-LIVE...Hear Big Al, "cranked up" and ready for a night's entertainment as he encourages and provokes his arch-rival "Pork Butt!"

2) PORK-BUTT...Listen to Pork Butt return the fire! Featuring the famous "white trash in America" monologue.

3) PIG-PEN-PETE..."HO HO, HO HO, HO" Here's our friend Pete, getting in his two cents' worth...and being severely admonished by his fellow amateurs for his efforts.

4) RALPH-THE-THIEF...Check out Big Al's response when he discovers Ralph's attempts to wreak havoc on his reception by transmitting the sounds of a BABY CRYING in Al's neighborhood!

5) THE-JAMMING-STOPS...Pork Butt on the offensive, commenting on Al's latest attacks.

It's amateur radio at it's best! Hear for yourself what I've been talking about on this forum. All original hits by the original stars of 3894.5 that made 'em famous! Digitally mastered for optimum sound quality and available NOW via your modem at the following FTP site: members.aol.com:/mnmaniac/3894.5

Don't delay! Download today! And thanks for yer support! :-)

Exactly. Nobody knows the difference and nobody cares. Here in Orlando, we have three FM pirate broadcast stations, operating out in the open. One is even bold enough to list themselves in the YELLOW PAGES! Nobody cares. I don't think the FCC is going to be running around and checking boats to determine which radio you're using for your VHF marine transmissions.

I wonder how many of these "holier than thou" types ever use their 10-meter mobiles on the CB band. Quite a few, I would guess.

4226. 3894.5Khz...THE BABY'S CRYING!

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-22 00:00:00 UTC
From: mnmaniac@aol.com
Message-ID: <19970222204001.PAA23100@ladder02.news.aol.com>
Source record: 204037

A new and highly amusing development has manifested itself here on "The Zoo of Amateur radio." Apparently, "Ralph the Thief" (as he is referred to by his fellow 94-point-5'ers) has rigged a remote control transmitter in Big Al's neighborhood in Hickory, NC. Ralph is playing a tape loop of a BABY CRYING via remote control in an attempt to interfere with Big Al's reception. In retaliation, Big Al has taken to playing a tape loop of his own regarding his personal thoughts on Ralph and the transmission of the BABY CRYING! <g> As always, a .wav file of this is available upon request.

And the hits just keep on coming...

4227. 3894.5Khz...WHO'S Jamming WHO?

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-22 00:00:00 UTC
From: mnmaniac@aol.com
Message-ID: <19970222203500.PAA22350@ladder02.news.aol.com>
Source record: 204038

With Pork Butt attending the Orlando HamCation last weekend, things were unusually quiet on "THE ZOO" both Saturday and Sunday evenings. However, there was some eruption of combative activity earlier tonight. The topic of tonight's battle was "WHO'S JAMMING WHO?" Donnie was blaming Polly for Al's actions and behavior on the frequency. Polly then blamed Donnie for blaming Polly for jamming when Polly was not jamming because Polly was being jammed while someone else was doing the jamming and...well, you get the idea.

Usual high-level noise floor underneath the main "participants", consisting mostly of bodily function noises, mild profanities, and rock music.

And the hits just keep on coming...

(this is what a person of class and intellect says, it does not
necessarily agree
with me and where he does not he resorts to facts over insults).
Burt

>Hello Burt,
> I just wanted to drop you a note concerning the thread currently running
on the rec.radio.amateur.equipment newsgroup. After ready the many
replies,
flames, etc, I would have to agree with *some* of your comments and
thoughts. I think you have a picture in your minds-eye of the "typical"
ham
operator being a rag-chewing, cigar smoking, foul-mouthed,
over-glorified
CB'er. Though there are MANY that fit that bill, but, I think better
than
half don't fit that desciption. As I'm sure you know, there are many of
us
who do public service such as Skywarn, RACES, ARES, etc. To group those
of
us who do public service with the lids is an unfair condemnation. I
literally put myself at risk when I go out and spot for the weather
service
and don't look at myself as being involved with a hobby at that point,
but
rather, an important part of a system that can and does save lives.
> After looking over your website, following the thread for the past few
days, and reflecting on the garbage I hear on some of the bands, I can't
argue with a good portion of your comments. Many of the respondants have
been very articulate, others have shown that they think with their
southern-most body part. I believe you are a person who is truly
concerned
about the state of Amateur Radio and it's related services. Your
opinions
may not neccessarily be within the mainstream of the hobby, but they do
count, and I respect that. I hope that you can also respect the efforts
of
those of us who DO look at Amateur Radio as a way to help others, and
show
that by doing the service work. We are not all lids, and I hope you can
see

that.
> I decided to send this note to you personally, rather than through the newsgroup, so as to try and get it back to the subject it is supposed to cover. I look forward to your reply, and your thoughts on my comments.

Please pardon this intrusion.

We are developing a free service called "The Online Consultant"
to provide a free central source of information about "How To Do
ANYTHING You Want On The Internet With Your Business." Although
focused towards the business world, it will be a wealth of
information for anyone trying to demystify the Internet. We want
this to be an easy, graphic, step-by-step "how-to" site for every
aspect of internet development--from getting personal internet access
all the way to building a high-end, corporate commerce server.

What we need is input. Please tell us what you wish you could have
here and your opinion of what's there so far. Any suggestions you
have regarding content, features, and sources to recommend are valued.
We will read every one and utilize the best ideas whereever possible.
Check back in a week or two to see what develops. In fact, we will
publish the ten best ideas.

Please check out the site at
http://www.interconnectivity.com/OC

(AOL 3.0 users can use this clickable link)
Online Consultant

Thank you,

Brad Anderson
Project Manager
The Online Consultant

The Online Consultant respects your online time and Internet privacy.

Source record: 204042

*** Attention All Ham Radio Operators ***

Are you looking for a more interactive way to chat
with Ham friends that you can't get to over the air?

AR-Net (Amateur Radio Network) has established an
IRC (Internet Relay Chat) server for you to use.

Here's how you can check this out..

1) Get an IRC client application
mIRC seems pretty good to me
(http://www.mirc.co.uk)

2) Dial up your local ISP

3) Point your IRC client to:
ar-net.woodyware.com
port: 6667

4) Change your Nickname to your Ham Call

5) Retrieve the list of channels
(we have 6 channels already set-up)

6) Join the one you are interested in..

7) Enjoy yourself!!

Give it a try.. Put a little more fun in our hobby..

John Woodstock woody@woodyware.com
P.O. Box 436 woody@usbbs.com
Coram, NY 11727-0436 Ham Call: N2HAA
SysOp Services: www.usbbs.com

Under a 1,000??? Surely you jest. You must never tune across 75m
at night. You'll find a group of them every 2 kHz. The problem is
not confined to just the notorious few HF frequencies. It is
everywhere on the lower HF bands. (Certainly the liddishness
varies from group to group, but none of these fellows will ever
make the A1 operator's club.) Ok, maybe you can find a *few*
good operators, mostly very late at night or very early in the
mornings.

>Where you'll hear exceptional behavior is from the CW ops who use
>CW as their primary mode. Easy to prove - just tune down to the
>CW segments.

Well, when you tune down to the *data* segments (there are no
separate "CW" segments on HF, only on VHF), you'll find swishing
carriers and strings of dits being sent to interfere with on-going
QSOs. And even down at the very very bottoms of the bands, are you
going to try to claim you've never heard FU FU FU being sent (very
fast of course)?

Now it is true that because it takes so blasted long to say anything
in Morse, there is somewhat less chance for operators to lose their
tempers and spout off with obscenities, but Morse ops have always
been inventive when coming up with crude abbreviations, even crude
abbreviations for crudities.

>
>Certainly the newer digital modes are faster than the old Morse code, and
>some may actually be more effecient under weak signal conditions.

They are, and of greater note, they are *much* more efficient under the stronger signal conditions which are much more common. Thus not only are they usable over a much wider range of condtions than other methods, but they excel by an even larger margin under the most common conditions.

>But the vast majority of ham HF rigs are used for single-sideband voice
>and do not have a multi-mode TNC & computer attached, just a microphone.
>When faced with with weak signal conditions, a marginal power source or a
>bad antenna, SSB voice transmissions may be uncopyable, but very often
>Morse code will still be readable.

And a large number of them also have no key attached, and have operators who haven't used Morse since passing their exams. In many cases, that was decades ago. To expect them to be able to use Morse, especially under less than ideal conditions, is unrealistic.

We must recognize this. ARRL surveys have indicated that up to 60% of ARRL member HF licensed amateurs never use Morse. And Morse usage is generally conceded to be higher among ARRL members than among amateurs at large. It is certain that any Morse skills this group may have once had at the time of their examinations have atrophied. So expecting amateurs to fall back on these atrophied skills in time of emergency is unrealistic.

Now there must be a reason that a majority of amateurs never, or seldom, use Morse. In fact there are probably several reasons. But I'd contend the primary ones are that they don't find Morse useful or enjoyable for their purposes. It is unlikely that, short of draconian annual retesting, there is any realistic way to change this.

Therefore, since there are inexpensive technological methods which offer superior performance to Morse under all conditions, and since they require little in the way of manual skills requiring constant practice to maintain, if we want amateurs to be able to perform under marginal emergency conditions, we should be working as hard as possible to get all amateurs to include those methods in their stations. Fortunately, again according to a somewhat dated ARRL survey, 22% of HF amateurs already have.

The idea that digital methods require a separate "TNC" and desktop computer shows a lack of understanding of digital methods. Many of

the digital methods do *not* use a TNC (actually only packet does,
and there are TNC-less ways of doing packet). Some sort of micro-
controller is *very* useful for protocol methods, but there are
digital methods which were in use before the invention of the
microprocessor which are still superior to Morse. Nonetheless,
single chip micros are so cheap, common, and generically useful,
several are probably already inside your radio, that it is foolish
not to use them.

Support for digital methods could be built into new HF radios for
little more than the cost of the electronic keyers already offered
for most of them, if the support is integrated into the radio design.
Icom already has a radio with digital modulation and demodulation
capability built in, and Kenwood could have added code to do that
to their new radio. DSP isn't just for filters. Protocol support
could be handled by one of the micros already on board, or added
as electronic keyer modules are currently added (they're micros too).

Almost all of today's radios have sufficient software controlled panel
keys to serve as (clumsy but adequate in an emergency) alphanumeric entry
systems, and most new radios offer LCD displays capable of displaying at
least one line of text in a marque fashion. So a separate keyboard and
video display are not essential, though I'd suggest provision be made
to optionally attach them for more convienent usage. Icom has offered
that too in another HF radio. (Or better, I'd like to see radios equipped
with an ethernet port, or at least a RS-422 port, so we could easily couple
them to more powerful computers if we wished.)

In other words, our radios already *are* computers to a large extent,
and becoming more so every day. So incorporating more direct support
for digital methods is, as the hardware guys like to say, only a bit
of software.

We should ask the radio manufacturers to do that. Perhaps we should
even ask the FCC to mandate that in the name of emergency preparedness.
It makes more sense than a Morse testing system which has failed to
keep a majority of HF licensees current in Morse usage.

The 10 V/m and even 100 V/m susceptability requirements are essentially
meaningless. The field from a close HT easily exceeds this.

10,000 V/m would assure protection for safety-critical equipment such as
life support, 1000 V/m
for mission-critical equipment such as cash registers, and maybe 250 V/m
for other stuff would
be much more realistic.

I suspect you are a ham in the tradition of KV4FZ, that notorious personality of the (14.313 MHz) airwaves. Never the less, I would enjoy meeting you on the air sometime, say, on 20 Meter phone in the General class portion of the band. I know you are a cw buff but I think phone would give a bigger audience for you and allows others to make comments more readily. However, if hams are as gutless as you say, there should be few comments.

As far as the facts about Little Leo's are concerned, I am sure you are armed with all sorts of technical data about their compatibility with the existing uses in the bands. However, I would like to know where you got such data because everywhere I go says that such data does not exist.
This is not to say that such data would change my position. I am against any commercial intrusion into the amateur radio allocations, especially the ones that are being fully utilized such as the 2 M and 75 cm bands.

I look forward to your reply.

Sincerely,

Michael Goad

Well of course a continous wave transmitter is easy to build (we
aren't allowed to build any other kind), but it is as simple to
arrange for FSK modulation as OOK modulation (and FM modulation
is almost equally trivial, though that doesn't have much application
on HF). The dirty little secret, however, is reception. A receiver
suitable for OOK is also suitable for FSK or SSB (and a FM receiver
is even simpler). There are no simplifications of merit to be noted
here for OOK reception. And decoding is much easier and quicker for
both SSB voice and FSK modulated Baudot/ASCII text than for OOK Morse.
So there is less chance for failure or disappointment. OOK Morse
decoders are notoriously slow, unreliable, and variable in quality.
But machine decoders are quick, reliable, and consistent.

>Amateur radio is still about operating, and while in the field,
>if something breaks, one should be proficient and feel comfortable

>well-needed radio and operator out of the action at a time when
>desperately needed.

I agree with all of this, to an extent. There is real value to understanding your equipment, and being prepared to repair it if necessary. Fortunately, there is no significant difference in the skills needed to repair a FSK transmitter and receiver than there is for an OOK setup. Voice systems are slightly more complex, but again not difficult to understand or repair.

What can be difficult to repair is a poorly documented piece of haywired construction. If you homebrew, document everything, don't depend on hazy memory months after the fact. And be neat and use clean layout practices. Design it for servicability and you'll save hours of frustration later. Design in diagnostic self-test features wherever feasible. This will let you troubleshoot with a minimum of external test equipment.

When troubleshooting and repairing equipment, you look at it in a different way than when designing or building it. The skill sets are distinct. This may not be obvious to the casual amateur, but it is very real. Don't assume that just because you soldered it together that you know how to go about quickly and efficiently troubleshooting and repairing it. You probably don't.

Actually, Burt, your news article has helped me to decide in favor of
sending the FCC an e-mail in SUPPORT of the ARRL's position and to
further encourage every ham I talk with to do the same. If you are so
against amateur radio and all it is and does that you are willing to let
the commercial interests come in and take over (you know they won't be
"shared" for long) two of the most utilized bands we have, why don't you
turn in your license and get out of ham radio all together.

If you believe that protecting the interest of amateur radio is not in
the best interest of the general public, perhaps you should come down
and
talk to some of the victims and rescuers involved in the aftermath of
hurricane Andrew in Dade County, FL. Amateur radio's ability to be used

in times of disaster is highly dependent on the bands the little leo's want. We cannot allow any intrusion on these bands if we are to be useful
to the public in times of emergency.

For the record, I am a communications technician for the fire-rescue department of a local county, so I do have some first hand knowledge of the events following hurricane Andrew and the utilization of amateur radio there prior to the arrival of outside help from FEMA and others. Because of its usefulness, there has been a greater effort by the local governments in south Florida to work with the amateur radio community to ensure that this service will be available in the future. Many agencies now have amateur radio stations in key facilities and have lined up operators to run them in emergencies. Some have provided learning materials for their own personnel who expressed interest in becoming ham radio operators.

I am not sure what your motivation is in backing the little leo's, but I suspect it is financial. What we are talking about here goes way beyond the almighty dollar in my book. I am here to let you and all who read this that we will fight this to the end.

Sincerely,

Michael Goad

In actuality, Burt has been invited numerous times to a moderated roundtable type forum on the band and frequency of his choosing. Each time, he is, what is referred to as a no show, thus proving the saying that those who talk the talk (the gut vs gutless scenario) don;t necessarily walk the walk

Look for the Burt special event station to be setup VERY near his home sometime around the end of March. The amateurs of Cape Cod and surrounding areas will be invited to attend this. One special feature will be to show Burt in his true environment. Hopefully, Burt will make an appearance and even work some stations (after all, we will be parked in his neighborhood) We (and there is going to be more than one) will be connected to the Internet and will be demonstrating the public minded Burt to all his neighbors

More details as time progresses

Not unless they were ham operators, they wouldn't

Come on Drew..this is as bad a suggesting that to get someone off the
air, it's alright to trespass and destroy private property.

Not proper form

>Surely you jest. You must never tune across 75m
>at night. You'll find a group of them every 2 kHz.

You're certainly right. Most of them live down your way too, from what I hear. A bunch of good-ole-boys with their KW+ amps and 200 foot towers, living in a trailer or camper in the middle of a swamp (good ground plane, after all...) I suspect most of them think the south won the civil war, too.

Of course, if we were to look at the >entire< 75m band, we'd see that at most you'd identify a couple dozen or so 'good ole boys'. That's the problem with HF. A couple of nitwits can jade a much greater number of people. After all, if these nitwits were on one of the local 2-meter good-buddy boxes, the folks up here in the nor'east wouldn't be able to hear them now.

>The problem is
>*not* confined to just the notorious few HF frequencies. It is
>*everywhere* on the lower HF bands.

I never seem to have a problem in the CW segments of the bands. I wonder why that is?

Total bullshit. Tommorow is Sunday let us have a go at it.
I can go on almost ANY band.
Why don't you cite ANY time a ham has accepted my challenge, they always have an excuse, (my rig is packed away, the antenna is down, or just no reply).

Hello Steve: "Not proper form" What is proper form? The FCC hands off the rich, skip shooting 11 meter band over the the public. The CB band did not go the way the FCC wanted. There are more CB'ers that hams. The mass produced ham equipment is also purchased by CB'ers and freebanders, keeping the price a little bit lower for all customers. The freebands are filled with most all countries shooting skip. And a lot of QST subscribers are CB'ers. The Linear advertisments are great.

"Operating INCORRECTLY" sure and so was going over the national 55 MPH speed limit. Did you drive 55, making me slow down and half to pass. Buy a radar detector(humor).

Is the CB and Freebands high activity due to a lack of what Amateur radio and it's members have to offer. How many guys have been turned off by the not so friendly, rule resighting, and know-it-all Amateur Radio Futurnity.

We hear all the ZOO frequencies, on the ham bands. CB has a lot of bad eggs also. But why do the CB'ers and freebanders out number the Amateurs. What are all numbers saying?

Jay at jay123a@ptw.com A Life Time good friend to Big Bob, famous CB'er and flossifier. Big Bob says, "You catch more flies with honey than you do with vinegar, Ten-4 Goood Buddy"

Spelling by Los Angles City School System, (graduate 1970, should have been 1967, but who's counting) the battiers in my Franklin spell checker died.

As a former California firefighter I feel qualified in respectfully
saying that kr4wm's comments below are just horse poop.

kr4wm@sccoast.net wrote

>I am a career firefighter. I work in a <paid> department, and do it for a
>living. I'm not some yahoo volunteer out to make a name for myself by
>doing stupid things.

Save the rivalry for the FIRE-L newsgroup; you know full well that over
75% of our nation's firefighters are volunteer/paid-call. I won't allow
you to degrade over 3/4 of our country's firemen.

>When I got my amateur license, it was then that I found out that
>certain ham radios could be modified to work out-of-band. At the time,
>our department was stiffed for funds, and occasionally, some of us would
>be inside a burning building with no way to communicate with the outside
>(lack of radios).

No excuse for using a 2m HT. Daily I see very good prices on Motorola
HTs on rec.radio.swap; just last week someone had 100 Mot HTs for
VHF-hi going for $25 each (see below). And resellers such as Tele-Path
have excellent prices on used gear, too. Once single fund-raiser would
have earned your department enough money to go the legal route.

Here's an example from rec.radio.swap:

Subject: Re: Motorola walkie-talkies for sale: $25.00 each
Newsgroups: rec.radio.swap
Radioshop@aol.com wrote:
>Quantity available 30: Motorola HT-220, 1 channel, 4 watt, $25.00 each.

What's your department's class rating? It must be very bad (which trans-
lates to expensive fire insurance for your community's residents) if
your comms are lacking as you say.

>It was a godsend that I obtained permission from our
>department's chief to use my amateur HT and mobile to transmit on the
>fire department frequencies!

Did you explain to him you were endangering your department's license?
Did you explain to him that modified amateur equipment might interfere
with other services and thus possibly endanger lives?
Did you explain to him that your amateur HT is not built to commercial
standards and might fail due to the heat of fire?
Did you explain to him that your HT is frequency agile and a slight

bump during firefighting might result in a change of frequency?

Regarding these last to points, having an HT gives one more of a sense of security during a fire and thus, you might place yourself further "into it" than if you didn't have the radio. Failure due to heat or freq'y change have now placed you in greater danger than if you didn't have any HT at all (you probably wouldn't have gone as deeply into the structure).

The fire radio service was created for you and your department's safety. Very high standards (e.g. NFPA) are set for comm gear; don't endanger yourself and those depending upon you by being so thrifty/lazy.

> I've
>also used my mobile rig when I was off-duty to call the F.D. Dispatcher
>and inform them of auto accidents that may have gone unreported for long
>periods of time.

Still no justification for not going the legal route. The proper gear is out there and a very reasonable price.

>Or to let them know that no emergency response was
>necessary, saving the wear and tear on our engines. At $700 per run, it
>adds up. Yes, all things considered, it costs about $700 to put a fire
>truck in the street for EACH CALL!

The your department needs a new fiscal officer. Even if you include depreciation, fuel, engine and pump wear, et cetera, it should be *far* below $700/run. Please document how you arrived at that figure (and don't include FF salaries - that's a cost to the department regardless of the number of runs).

> 73, Web Williams, KR4WM, City of Myrtle Beach Fire
>Department, Myrtle Beach, SC

73,
Jeff KH2PZ (former Fireman II for City of San Clemente, and Calif. Division of Forestry)

P.S. I'd say it's about time to petition manufacturers to design amateur-only radios; the major benefit would be better performance.

That's because you were tuned to the wrong bands. If you would have
been listening just below the AM bcst band to 500 kHz, you'd have known
almost every high seas maritime disaster over the last century was
handled via CW on that freq'y. Even the most recent sinking off the
East Coast about 2 years ago was handled on 500 kc.

It was a very good, reliable, and simple system that served the
maritime community for 80 some years; let's hope its replacement
will continue to guard "...those who go down to the sea."

Semper Paratus,
Jeff KH2PZ (ex 500 kc CW op at Coast Guard Radio Honolulu, NMO)

You've apparently done all that on VHF. But now one can get on
VHF without the code, so the point of your story has been lost
to me.

The problem is that in between emergencies, will these public
safety-minded hams just yack on the rptr, or will they be attempting
to satisfy the other parts of our charter as outlined in S97.1?

>That included one of the first (the first?) uses of packet radio
>during an actual event (the Aeromexico crash, Cerritos CA 1986).

No coded license is needed to do that today.

>I HAVE seen several occasions where I wish I had had a 12-year-old
>with a dirt bike and an HT, but 12-year-olds say "I started working
>on my license, but that Morse Code stuff is so boring . . ."

Then you're failing in recruiting these kids by not informing them
that over 97% of the amateur spectrum up through 23cm is available
via the no-code tech license.

Wonder why Jerry didn't scold you for not signing your callsign?
He does that to the pro-code folks.

Gary Coffman (gary@ke4zv.atl.ga.us) wrote:

: We must recognize this. ARRL surveys have indicated that up to 60% of
: ARRL member HF licensed amateurs never use Morse. And Morse usage is
: generally conceded to be higher among ARRL members than among amateurs
: at large. It is certain that any Morse skills this group may have once
: had at the time of their examinations have atrophied. So expecting
: amateurs to fall back on these atrophied skills in time of emergency
: is unrealistic.

We don't even use CW during our monthly RACES training. In fact, all of our RACES and ARES nets and activities use VHF packet, HF packet and SSB and FM voice modes. Among those of us who are "regulars" participating in these emergency-preparation activities, only a few of us are CW-capable, even though many of us are General Class or higher.

: Now there must be a reason that a majority of amateurs never, or seldom,
: use Morse. In fact there are probably several reasons. But I'd contend
: the primary ones are that they don't find Morse useful or enjoyable for
: their purposes. It is unlikely that, short of draconian annual retesting,
: there is any realistic way to change this.

Maybe because Morse is presented in a negative way to newcomers? Does anyone bother to note that it can be fun?

If hams don't use Morse regularly, annual testing won't be anything other than a burden to all involved. If they don't use it, why test for it, except perhaps as a qualifier or endorsement to use the CW sub-bands?

: Support for digital methods could be built into new HF radios for
: little more than the cost of the electronic keyers already offered
: for most of them, if the support is integrated into the radio design.
: Icom already has a radio with digital modulation and demodulation
: capability built in, and Kenwood could have added code to do that
: to their new radio. DSP isn't just for filters. Protocol support
: could be handled by one of the micros already on board, or added
: as electronic keyer modules are currently added (they're micros too).

It makes one wonder, if it wouldn't make more sense to build digital technology into today's modern HF rigs? After all, as you pointed out, 60% of today's hams don't use Morse, so why not include a TNC instead of, or in addition to, the electronic keyer that's included already? In a top-of-the-line rig, there's already more stuff built in, than most of us use - or can use, without having the manual open.

: We should ask the radio manufacturers to do that. Perhaps we should
: even ask the FCC to mandate that in the name of emergency preparedness.

: It makes more sense than a Morse testing system which has failed to
: keep a majority of HF licensees current in Morse usage.

I'd support your idea, although I think packet is a joke, at the speeds allowed today - especially on HF. Yes, I've done the math re: bandwidth. At one time, it was one way to communicate among members of the local club and ham community. Now, more and more of the local hams are getting on the Internet, especially with the availability of Juno for free.

This isn't intended to take either side of the CW issue. As much as I enjoy that mode, I can see the need to reduce or eliminate the requirement - with the exception of access to the CW subbands for other than digital modes.

Let's rewind a little here. Someone said "I want to use my ham radio
in the land mobile/marine service". You responded with:

> It is not impossible to do it... But it is not good engineering practice.
> Amateur Radio equipment is not type accepted for marine use for a reason;
> they are not as clean on the output as the type accepted ones are.

I followed up with a comment that reason that amateur gear is not type
accepted for marine service has to do with how operating frequency
is selected.

What is wrong about this statement? Why are you "questioning my
relevance" in this discussion?

>Unless extensive modifications are made to those chains, it's likely that
>the signal transmitted will lack the spectral purity the radios which are

>designed for the service would have. As for the receivers? They too would
>usually would suffer some performance characteristics as well.
>
>Again - it is poor engineering practice to do this.

Perhaps, and then again perhaps not. First of all, the transmitters
I've looked at tend to use bandpass and lowpass filters; a radio intended
for use at 148MHz will probably have reduced output above 150MHz. It
is conceivable that the carrier level would drop more rapidly than
the harmonic levels, resulting in a degraded harmonic suppression
when measured relative to the carrier. However, with the drop in
the carrier level, it is more than likely the harmonic output
would be at a lower absolute level than if the radio were being
operated in the 2m band it is designed for, which suggests the
potential for interference is not degraded.

It is well known that many amateur transceivers suffer poor receiver
performance outside the amateur bands. However, there's nothing
in 47 CFR that require type acceptance for marine band receiver.

Don't overlook the fact that some amateur radios *are* designed for
wideband use, and are then configured for a particular country. Looking
at the service manuals for several radios I've seen just this case - my
TR-2600A actually has extra circuitry to insure operation from 140-160
MHz, and this is enabled in export to certain countries. The IC-2000H
is similar, as well as many others

So, while some radios are indeed not good performers outside the
amateur band, others are. The potential for interference that
type acceptance attempts to address is interference caused by
improper selection of operating frequency and mode, not dirty
emissions or poor receiver performance. Technical standards
for emission purity exist regardless of type acceptance standards.

If I am in error, please feel free to show me exactly where.

>some way that this danger is handled, since so many vertical antennas are
>in daily use by SWLs and hams.

You have to provide a path for lightning currents to be diverted to Earth in such a fashion that they don't go into your house and your equipment. This is, of course, easier when you use an antenna design which is bonded directly to Earth, the so-called plumber's delight beam is one example, a shunt fed vertical is another. Sometimes there are reasons why you want to, or have to, isolate the antenna from direct Earth connection. That makes the lightning mitigtion job a bit more challenging.

In cases where the antenna must be electrically isolated from Earth, you have to use a controlled discharge device. This is basically a spark gap designed so that normal operating voltages won't fire it, but so that the higher voltage of a strike will. The simplest spark gap is just an air gap, but because of varying humidity and air pressure, an air gap's firing potential is ill controlled. The better approach is to use a special gas tube. These tubes are manufactured with precise gas mixtures and pressures to ensure a very predictable firing potential. You want to select a gas tube which has a firing potential just above the normal transmitting potential at the point of insertion. The suppressor should fire very quickly, in less than 2 nanoseconds, and should become a *very* low impedance when firing (typically on the order of

a few milliohms). Polyphaser makes suitable suppressors.

Now lightning energy is *RF*. The energy of the pulse is distributed over a very wide frequency span from ELF up through UHF, but most of the energy is concentrated in the range below 2 MHz. There is so much energy in the lightning discharge, however, that you can't ignore the higher frequency components. This presents quite a challenge for antenna protection because of the many possible resonances in the antenna, antenna support structure, feedlines, and lightning downleads.

There will be nodes of high voltage and nodes of high current distributed over these conductors by the lightning discharge. Since the lightning energy spans such a large frequency range, the number of such nodes is huge, and it is impractical to analyze them all. However, there is one which is of interest. The suppressor you install should have a firing time on the order of 2 nanoseconds, so we are interested in the voltage and current distribution at a frequency of f = 1/t or 500 Mhz.

If practical, we'd like to install the suppressor at a point which is a multiple of a halfwave at 500 MHz from the antenna tip. This will put it at a high voltage node for the strike during the period when the gas tube is building to firing potential, assuming it is the antenna tip which is struck. That's good because it will allow the largest differential between the required hold off voltage of the suppressor due to your transmitted signal and the potential generated by the lightning discharge. In other words, it maximizes the margin for the suppressor.

In your case, it is more important to put the suppressor directly at the antenna feedpoint, because that will be a current node for your transmitted signal on 20m, and will maximize the margin to a greater extent than if we ignored that and located the suppressor back down the line where it would be at a lightning maximum. There is a "sweet spot" a few inches back from the antenna base where the highest differential will occur, but anywhere within those few inches will suffice, and we might introduce extra unwanted inductance in the lightning path by locating the suppressor back from the feedpoint too far.

Now inductance is the killer in the path to Earth. We want to minimize that to every extent possible because it will act to elevate the suppressor above Earth during the strike. And that will elevate your coax shield, which will elevate your equipment, and that allows a large current to flow through your equipment to *its* Earth connection.

Ideally, your feedpoint will be directly at ground level, with an essentially zero length path to Earth for the suppressor. Even a few feet of straight wire will have sufficient inductance

to elevate the coax shield. So keeping this path short and straight is vitally important. (Obviously, any bends in the downlead will add inductance.) The lightning downlead must be at least #6 wire, but a flat copper strap has less self-inductance and a greater skin area for a given amount of copper, so that's even better. Note do *not* use braid. It has a high self-inductance and a high skin resistance compared to smooth solid strap.

OTOH, we'd *like* to have some inductance in the feeder going into the shack. This will raise the impedance of the path for lightning currents trying to reach your station ground. Coil a few turns of the coax into a choke balun near the feedpoint to provide this inductance. The phone company uses a half turn loop, called a "drip loop" for this purpose in their installations. We'll use a few more turns here.

Now this is all standard stuff, but you have another problem with your installation. As I understand what you said, you're going to stand the element up next to your house. This introduces the possibility of *sideflashes*. Sideflashes occur when the impedance to Earth is lower through some other structure than through your intended downlead path. This can happen because of the resonance effects noted above, and because of plain inductance in the downlead path. The rule of thumb is that all conductors carrying lightning surge should be at least 5 feet from any structure not intended to carry surge currents. So be sure to stand your antenna off at least that far from the house.

If I've misunderstood, and you intend to mount the antenna on the roof, then you've got to be *very* concerned about downlead inductance. Keep it straight, keep it wide, and keep it short.

Lightning can be considered to be a constant current source with a current on the order of 8000 amperes. The potential backing the constant current source, IE the cloud to ground potential, can be many millions of volts. There is no practical way to insulate against that. When you try to impede that current flow, due to resistance or inductance in the current path, those millions of volts will express themselves across the impedance and drive sideflashes. That's why it is so vital to minimize inductance in the downlead, and why you need a large standoff distance to other structures.

As a final barrier, be sure to use a suppressor in the coax at the station entrance bulkhead. This bulkhead should form the *ground window* for your station. A ground window is the point to which *all* conductors entering or leaving the station area are tied, either bonded directly if nominally of ground potential, or tied via a suppressor if they carry operating potentials. This includes *all* conductors, including station AC power, the telephone line if a telephone is in the station area, any CATV line, etc. The ground window serves as the

station *single point ground*. It is then tied in turn to
a good Earth ground via a direct low inductance path.

The purpose of the single point is to ensure that if the
station's nominal ground potential becomes elevated during
a strike, all conductors become elevated roughly equally.
If there is no potential difference, there can be no damaging
current flow through equipment attached to those conductors.
Note that all conductors entering the station area must be
tied to the ground window *first* before going on to the
station equipment. And don't create daisy chains inside
the station. All equipment grounds should go directly to
the ground window. Bypassing the ground window with just
one wire will negate its protection.

The latter can happen all too easily. For example, if you
run an extension cord into the station area "temporarily"
instead of using conditioned station power which has entered
the station area through the ground window, a strike can fry
all your equipment, even though you've done everything else
right.

I am the way I am because as a teen I was an active ham radio operator. I used "the mike" to not face real people thus missing my teen years the way real people experience it. It is not ham radio's fault of course, the fault is entirely mine. However I am not that person now and I despise in others what I despised in myself. I am much like a reformed smoker (they tend to be fanatics against smoking). When I hear hams on the air blabbing on about nothing, doing nothing, being nothing, kissing each others butts so much their lips turn brown I want to anything other than be like them. Further I was a gutless wimp up to 18 years of age (fit
in well with ham radio), I would cower with the slightest threat but I learned that fear is far worse than being beat up and rarely would have anyone beat me anyway. So today if you want to threaten me the odds are high (especially if you are a ham) that nothing will ever be carried out. And if threatened I always tell the person to carry out the threat even if my acts that caused the threat were wrong because once you threaten me that closes the door as to the legitimacy of your cause.

To those folks in the ASD support group much of the above applies. Most of you are uncaring men whose spouses finally wised up (hams make great uncaring spouses). In the end I am a far deeper and caring person than 90% of you. And to those that PERSONALLY insult me and/or use profanity, those acts say so far more about you than I. If you read my mail carefully you will rarely see me personally insult anyone and rarely will I use profanity. I argue ON THE MERITS. When you see someone attack the person it means their cause is without foundation.

I wonder why, whenever anyone gets into this big type acceptance issue of using "Amateur on Commercial Freqs", nobody ever asks why so many of those damn Commercial radios that everyone has on the ham band is never mentioned. They are not type accepted for Amateur use either. Spectral purity, out of a commercial Maxon-Regency-Uniden, not very likely. The real issue, people using $300 keyboard programmable radios for their plumbing business rather than going down to the Local Moto shop and buying a $800 GP300, thats it, plain and simple, and is probably the biggest part of the "Type Acceptance" equation.

One of you is right, it is simply the keyboard programmability that keeps the amateur radio out of the commercial band, as far as type acceptance is concerned. A Moto JT1000 has a UHF bandwidth of 403-470, as does most Yaesu FT50s, filtering, or lack there of is virtually identical, like in zilch. But the JT supposedly takes a rocket scientist (i.e. 2way tech with a key) in order to "keyboard" program the thing, while the Yaesu takes someone who can read. Type acceptance of the Icom U/H-16 portables (commercial) was temporarily suspended when FCC found that anybody could actually keyboard program the radio, and reinstated when Icom made the access to the keyboard more difficult for the end user. Yet, this very radio was sold in amateur radio service as a Icom 02AT and O4AT, and check a schematic and parts list, they are identical in every way except the software, which allowed easy keyboard entry. Harmonics, intermods, and selectivities, had absolutely nothing to do with the type acceptance issue, only the ease of frequency moving, and of course, the commercial U-16 sold for several hundred dollars more that the 04AT.

So basically, when the FCC knocks at your door, then and only then does it really matter. And if you actually have a license for the frequency(s) you are using the "unaccepted radio" on, the penalty will be worth the savings.

Some fun reading, check out the NOIs and NPRMs over the last several years regarding type acceptance issues, and take carefull note of who it is that is petitioning the Commission for most of the changes (stricter) changes, and you will find a lot of Schaumburg and Lynchburg addresses.

4272. FT-900AT vs IC-706 - Opinions Sought ?

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-23 00:00:00 UTC
From: "Martin A. Gillen" <M.Gillen@nortel.co.uk>

Hi.

I am looking to replace my current HF rig (FT-902DM) with a modern one. I have narrowed my choices down to the Yaesu FT-900AT or the Icom IC-706. I like the Yaesu omni-glow and look&feel, plus the inclusive ATU is a good thing.

On the other hand, the IC-706 is roughly similair in size and specs, except that it also has 6m & 2m. The IMD stats aren't very impressive compared with the Yaesu.

So, does anyone have an opinion regarding which is the better rig ? Or does anyone who owns one or the other of these rigs have any opinions regarding whether they like it or loathe it ? Has anyone had any problems with these rigs ? I've heard of the CPU clocks in the FT-900 being radiated by the mic cable, but this isn't a problem as long as the antenna is kept far enough away from the rig.

Any comments or opinions would be gratefully received.

- Martin.

In article <3310B581.4BB8@geocities.com>, burtfisher@geocities.com says...

> If you operate a PBBS to serve all amateurs who the hell are you to
> decide what THEY should read.

Exactly..*I* am the owner/operator of the PBBS and *I* decide what gets read. *I* take the input of the people who utilize MY equipment, *I* decide what content is acceptable or not. Not YOU or the FCC

That's who the hell *I* am. *I* and the others on my PBBS consider your posts inappropriate to anything related to amateur radio, hence, no posts.

I firmly believe you have every right to show the fool that you may or may not really be. HOWEVER, I DO NOT repeat, DO NOT have to give the platform to prove it. That's for others to do.

If you're suggesting that I have to allow you to access my property (equipment, etc.) then you are barking up the wrong tree.

In article <5emrhq$ej5@news2.cais.com> packer@cais.cais.com (Charles Packer) writes:

> Could a practical, portable device be designed that would
> detect hidden video cameras nearby?

You would need to detect the RFI put out by their logic circuits. With the
little CCD cameras, this could be difficult especially if the camera designers
are trying to prevent detection by shielding them

> Could a device be designed that would jam them?

That would be even more of a challange. If they are wireless linked, you
could jam that. But handling the general case would be unlikely.

After reading all this drivel from the pro-code testing group, I've come
to
the conclusion that you're too lazy to use a call sign server. Your
ability to use a computer sucks!

> Instead of pissing and moaning
> like you do why not move down the band and have a contact or two.

Instead of pissing and moaning about people wanting something for
nothing, why not look up a callsign or two and see who you're trying
to condemn as lazy.

> You may
> actually find that you will meet a better class of person, polite and
> courteous, indciative of the old-time spirit and fraternal aspect of the
> hobby that attracted you to it in the first place.

You might actually find that there are extra, advanced, and general
class
licensees that don't hold Morse Code testing in such a god like
position.

> Five words a minute is not hard to learn nor will it take up too much of
> your time. I challange you to try it and have a few QSOs on CW! See how
> different things are at the lower end of the bands. Know of what you
> speak.

Using a call sign server is not hard to learn, nor will it take up too
much of your time. I challenge you to learn a little about the posters
you lambaste before you place both feet firmly in your mouth.

> Otherwise you are no more than enhanced CBers, appliance operators with no
> appreciation for the wonderful privileges available to you. Just listen
> to the difference in attitude in the two band portions and then tell me
> that CW is useless! That is,if you can!

Otherwise you are just stand along computer users with no notion of how
to use
online services. Just use something other than usenet and see what
a difference it makes. That is, if you can!

SB DX @ WW $OPDX.293
Ohio/Penn DX Bulletin No. 293

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 293
BID: $OPDX.293
February 24, 1997
Editor Tedd Mirgliotta, KB8NW
Provided by BARF-80 BBS Cleveland, Ohio
Online at 216-237-8208 14400/9600/2400/1200/300 8/N/1

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, KA2AE, NG3K, N4GN, WT4K, DJ5AV & DX News Letter, DL4VBP, G4BUE & DX News Sheets, HP2CWB, LA1K, LA4YW, LU1DZ, PA3CQR, PS7AB, PS7KM and SP2FOV for the following DX information.

3B8, MAURITIUS. The "DX News Letter" reports Mart, DL6UAA, will be on 3B8-land between March 16th and April 3rd. His activity may include operations on AO-10, if his licence arrives in time.

3Z, POLAND. A special event station will be active from March 1-31st, to celebrate the city of Gdansk's 1000 years anniversary. The Police Radio Club station in Gdansk will be using the special call 3Z2GD. QSL via SP2FOV.

4S, SRI LANKA. The "DX News Sheets" states to look for Mario, HB9BRM, to be active from March 3rd to May 30th, or possibly longer as 4S7BRG. QSL via bureau only.

A3, TONGA. Ulmar/DK1CE, Hilde/DL5UF and Bert/DF5WA will be active from now until March 10th. During their stay, they would like to try to activate the following IOTA's: OC-049, OC-064, OC-164 (no further description given). Operation will be on CW/SSB/RTTY. Their equipment consists of a TS-690AT, IC-735 and a Yeasu FL-2100Z amplifier. Antennas consist of a FD4, R5 and some dipoles.

BS7H, 1997 DXPEDITION TO HUANG YAN DAO (Scarborough Reef). The following is an excerpt of the anticipated official announcement that was released by Tim Totten, N4GN, on February 16, 1997. OPDX InterNet Subscribers will receive the complete announcement as an additional bulletin: "The Chinese Radio Sports Association (CRSA) has today announced plans for the third DXpedition to Huang Yan Dao, located in the South China Sea. A multinational team, led by BZ1OK and JA1BK..... expected to commence the one-week operation from Huang Yan Dao on Wednesday, April 30th, using the

call sign BS7H. The primary goal ..... is to provide at least one QSO with as many individual DXers as possible. For this reason, the operators will concentrate on those regions having the most difficult propagation paths (e.g., the eastern half of the U.S.), giving DXers in every corner of the globe the best possible chance to make it in the log.
A secondary goal will be to provide QSOs on additional bands and modes, including 160 through 6 meters, CW, SSB, satellite and RTTY, with as many as four stations simultaneously on the air. Operators for BS7H include BZ1OK, JA1BK (who will also serve as QSL manager), JA1RJU, N7NG, W6EU (ex-WA6AUE) and W6RGG. The complete operating team, as well as the list of transmit frequencies, will be announced once they have been finalized. Further details will be announced on the DX reflector and the BS7H 1997 Home Page (http://www.iglou.com/n4gn/sr/) as they become available. For additional information, please contact Tim Totten, N4GN (ex-KJ4VH), at E-mail n4gn@iglou.com or fax +1-502-239-7766."

INSIDE DX. It has been reported that Art, N2AU, editor of "Inside DX" has decided that issue 401, February 14th, will be his last bulletin. After 10 years of dedication and 400 issues, the DX Coummunity will miss him.

LM1SKI SPECIAL EVENT STATION (Attention Prefix Hunters!). Students from the radio club station LA1K will activate LM1SKI during the 1997 Nordic World Ski Championships. They will be active from now until March 2nd. Operations will be on all HF bands, CW/SSB/DIGI as well as VHF/UHF. Their town is also celebrating its 1000th anniversary this year, but there will be no more special calls from Trondheim except the above mentioned operation. So, prefix hunters should therefore use this opportunity to catch LM1, which never before has been used on the air! QSL information is via LA1K. Both bureau cards as well as direct requests will be handled. The new address is preferred: Akademisk Radioklubb - LA1K, Elgeseter Gt 1, N-7030 TRONDHEIM, NORWAY. A special QSL will be printed for this event. Visit their web-page (http://www.samfundet.ntnu.no/la1k) to find out more about their club station and town. LAST MINUTE UPDATE: LM2SKI will also be active on the air. QSL via LA2T. Both stations are now reported to be active on all bands CW/SSB/RTTY.

PANAMANIAN IOTA DXPEDITION. Operators Jose/HP2CWB, Emilio/HP2DFU, Ricardo/HP2CTM and possibly others plan to activate IOTA NA-202, Colon Provivce Group, Sunday, March 9nd. Possible callsigns to be used will be: 3F2A, H32A, and H82A. The group will try to activate a new island from this group, Isla Grande, but if not, look for them to show up on one of the other following islands: Naranjo Arriba, Naranjo Abajo, or Dos Marias O Dos Hermanas. Activity will be on the usual IOTA frequencies 40-10 meters CW/SSB. QSL via HP2CWB's Miami, Florida address: Jose NG Lee, Direct Distribution LTD, PTY-201, P.O.Box 02-5275, Miami, FL 33102-5275.

PQ/PY, MEL ISLAND POSTPONTED. Lira, PP5LL, states the PY5AA and PQ5L DXpediton from Mel Island (IOTA SA-047, DIB-24, DFB PR-01 and DFH PR-01), which was to be active this past weekend, will now take place April 17-22th.

QSL INFO AND NEWS.....
Please note that WT4K is now QSL manager for: KG4GC, KG4AU, KG4FD KG4WD and KG4AN. Send requests to: Bill Gallier, 4094 Sandy Run Dr. E., Middleburg, FL. 32068. (WT4K x-KQ4GC) ALSO NOTE: KG4AA and KG4US are pirates. These calls have not been issued. WT4K states he will also help anyone with QSLs to other KG4 stations. Send a note in SASE or via E-mail (wt4k@bellsouth.net) with your problem.

LU6Z CARDS. The latest news coming from GACW and the LU6Z QSL manager Raul, LU6EF, is that the last batch of direct cards of the LU6Z South Orkney Island 1995/96 operation was mailed during the first week of October, 1996. Those who have not received their cards are invited to send another request to: P.O. BOX 9, 1875 WILDE, Buenos Aires, ARGENTINA. DO NOT SEND ANY GREEN STAMPS, but 2 IRCs are requested for USA/EUROPE and 3 for ASIA/AFRICA and OCEANIA. Meanwhile, the GACW is now replying to bureau cards, and to avoid delays in the Argentine bureau, they will be sending direct batches by mail to the foreign bureaus. Also, QSLs for the following other GACW DXpeditions and operations can be obtained via the same address: LU7X, L8D/X, LU3ZI, LU2ZC, LU6UO/Z , LU5EVB/Z; and the following special prefixes/event operations made by AY1DZ, AY6EF, AY5DVO, AY5EIE, AY9HGW, AY5BB, AY4FC and AY1CJY.

ARMENIA POSTAL PROBLEM. OPDX received a message signed by several Armenian amateurs (EK6GC, EK6OCM, EK6DO, EK6CC, EK6GCF, EK4JJ, EK4GK, EK6SW, EK6GB, EK6GO ...) stating that EK has a postal problem and envelopes are being opened with their contents being stolen. The Armenian amateurs are very sorry that this is taking place, and for amateurs who are still not receiving a QSL from EK. Steps are being taken to try to correct the problem. The Armenians had a conversation with the Ministry of Communication of Armenia, and he has given a promise to correct this situation. They hope that the problem will end soon and everything will be OK to send a QSL to EK in future. They ask to report any problems via their E-mail address: ampr@arminco.com

QSL info for the recent St. Peter & St. Paul Rocks DXpedition:
ZY0SG via PT7AA: Pergentino L de Andrade, Av Ososrio de Paiva 75, 60720-000 Fortaleza, CE, Brazil
E-mail: pt7aa@fordx.ampr.org

ZY0SK via PS7KM: Karl M Leite, Rua Estacio de Sa 1838, 59054-580 Natal, RN, Brazil
E-mail: kleite@summer.com.br

Visit the St. Peter & St. Paul Rocks Home Page at:
http://www.glomec.com.br/rocks/index.html
Karl, PS7KM, would like to thank the many people who are sending more than 1 green stamp to cover postal costs. They state the team really had a lot of expenses with the trip, and "extra" green stamps has really helped them...

TT, CHAD. Look for EA2CLU to be active now through February 28th. He will use the callsign TT8FC and plans to be active on CW and SSB during his free time on this business trip. A QSL Manager will be announced

at a later date.

TY, BENIN. Arnold, TY1NI, will be active from here the next two weeks. He runs 100 watts in an FD4 and will be operating mainly on SSB. QSL via PE1IVQ. BTW, he does have an InterNet address: Arnold.Bosch@Net.WAU.NL

V2, ANTIGUA. (The following is an excerpt of a press release. A full and complete release will be sent to all OPDX InterNet Subscribers as an additional bulletin). Team Antigua is again pleased to announce that it will be activating V26B in the upcoming ARRL International DX SSB Contest in March. They will be entering the contest as a Multi-Operator and Multi-transmitter catagory..... They will be there from February 27th to March 4th. Operators are: V26A (N3BNA), V26AK (WB2P), V26B (WT3Q), V26DX (KK3S), V26E (AB2E), V26T (K3MQH), V26R (KA2AEV), V26RN (KR2J), V26TS (KF3P) and V26U (WA2UDT). QSL via their homecalls..... A 5 band and 6 band Certificates of Appreciation will be available once again for the 1997 operation. Briefly, to qualify for these Special Certificates of Appreciation, all you have to do is work V26B during the ARRL SSB Contest period on either 5 bands, or to receive the Special Certificate of Appreciation, 6 bands! Team Antigua has many members of the Frankford Radio Club and are celebrating their 70th Anniversary by sponsoring a very special award. Additional information for this special Certificate and a full list of members of the Frankford Radio Club may befound on their WEB page at: http://www.frc-contest.org/70th.html
Members of Team Antigua will also make special attempts to be active on the WARC Bands, RTTY, 160 meters, as well as some Satellites! Also, check out the V26B WWW site, complete with photos and descriptions of their station. Its URL is: http://WWW.frc-contest.org/v26b.html

ZF, CAYMAN ISLANDS. Operators W5AU, K5RV, W5FYZ, N5EPU, and N5XIQ will be active February 27th through March 4th. Activity will also include participation in the ARRL DX Phone Contest using the callsign ZF2FT. Operations will be on 160-10 meters. CW operation will take place mainly before and after the contest. QSL via K5RV (ex N5OCD).

4281. Looking for software

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-23 00:00:00 UTC
From: michaelabarnes@juno.COM
Message-ID: <19970223.150533.5359.2.michaelabarnes@juno.com>
Source record: 203892

Thanks for reading this message.
I am looking for a software program which will dial a phone number, then play a recorded file. I saw one some time ago which was designed to call people soliciting sales or something like that. I think it was part of an answering machine/voice mail type package.

My use is to call the repeater reverse patch at specific times to make announcements over the system. I know that there are repeater controllers which can do this but this is the way we want to do it.
We also want it to call other numbers besides the repeater. If we can find the software, that is.

I do not subscribe to this newsgroup, so please e-mail me direct.

I prefer commercially available software, but if there is something downloadable I can arrange to do that as well.

Thanks for any help any of you may provide.

73,
Michael

Way to go! Just goes to show even if you're not 100% ready for an exam element, just keep taking them until you fail (fall?). You just might luck out. Anyway, congratulations on experiencing the purest part of the amateur radio experience, the one that is as it was supposed to be from the beginning of the hobby - actually studying for and taking the test. The only catch is staying awake after hitting the power button on the rig after a few years.

Mark, who's adrenaline level is admittedly lower than average.

Source record: 203894

I am having some trouble selecting a antenna.
This is what I have, an old Tempo One Rig, 10-80M, Vectronics 300dlp
ant tuner. I am looking at 3 antennas in which I would like to buy for
it, they are:
G5RV about $50.00, All-bander dipole from HRO about $29.00, uses
450ohm ladder line, or another one called a Fritzel ant, about $109.00
not too sure on this though. Any comments on these ant would be
welcomed, and which one would you use???
What do you know about the Fritzel ant??
Thanks for any and all comments Thanks Stan KC2ADC

You are using public frequencies you have a moral right to allow all
comers.
Next Maybe you will deny access based on color?

In my Plymouth the FM radio generates what sounds to be a carrier on
certain UHF frequencies when I am tuned to certain FM stations. These spurs
are constant though. My experience has been that electric fuel pumps
generate a distinct motor type of hash.

In all honesty, Burt, you are the only one I've ever "locked out". And quite frankly, I have found very few if any locally who will agree with anything you have to say concerning amateur radio

I also reserve the right to preview all for sale messages for content. I allow only amateur and amateur related materials to be posted. Cars, guns, recipes all get round filed.

Funny, I have yet to see a radio that can determine a person's color
based on a callsign. Is this something new?? How can I tell a person's
color based on his posting to my PBBS?? Enlighten us Burt

>
> ...Peter

This thread is morphing from jamming to immunity, but....

Peter, you talk of realism. From my personal experience, most USA grade consumer electronics will crap out at about 5 Volts/meter. (This may now be starting to get better, as manufacturers design to meet EN standards and use the same design for USA.)

You say an HT "easily" exceeds 100 V/M for near field. Could you run me some numbers as to how strong the near field strength really is for, say, a 5 watt HT? (We are talking about an HT at 2 meters, with 5 watts into a ducky, right? Or maybe a cell phone at 1 watt at 900MHz.)

Now, let's move into your recommendations for immunity. Sure, we all would like our Gameboy to stand 10kV/M, but I think your eyeballs (and other balls) would pop like a bean in a micro oven at much lower levels. Ten thousand volts per meter electric field strength! No doubt over a frequency range of 10 KHz to 18 GHz. Have you any idea of what you are asking?

Can you tell me of any facility in the world that can generate even 1000 volts per meter over this range? If you wish to set such a standard, then you must expect that manufacturers world wide will be expected to actually TEST to that standard. ("Designed to meet" doesn't cut it in the world of RF immunity.) Do you realize the cost of all this testing?

(Mortgage the house and invest in RF amplifier companies!)

Finally, while I respect the capitalistic jingle of a cash register, I find your description of this instrument as "mission critical" to be absurd. "Mission critical" has an urgency which transcends "do you want fries, too" "Mission critical", to an engineer, means someones life is on the line; think night carrier landings or a shuttle launch or your anti-lock brakes or a premie incubator.

One thousand volts per meter a safe level for a cash register? So, just who will be standing at that register in that 1000 V/M field. Certainly not me. I have had the personal experience of 200 V/M whole body exposure. (If you must know, it's kinda pleasant at first, like a warm mellow feeling in your bones.) I can assure you that nobody would just stand there, looking goofy while they cooked. I can't say which way, or how fast, but run they would.

And now, 250 V/M for "all the other stuff". What can I say, other than "Read the above paragraph again!"

I'll close by listing my personal suggestions for consumer grade electronics. I freely admit that I am making a lot of sweeping decisions, but hey, it's MY list.

10 KHz to 500 KHz 2 V/M
.5 MHz to 1.7 MHz 10 V/M
1.7 MHz to 88 MHz 5 V/M
88 MHz to 175 MHz 20 V/M
175 MHz to 425 MHz 10 V/M
425 MHz to 500 MHz 20 V/M
500 MHz to 900 MHz 10 V/M
900 MHz to 2 GHz 20 V/M
2 GHz to 12 GHz 10 V/M
And further thought must be given to the bands used by vehicular doppler radar and the new wave of home communication and PCS stuff.

Comments / great thoughts / warm air invited!

Jeffrey's points are sound advice. I doubt the manufacturers will adopt a policy such as this since too many CBers or hams (seems the same now) are always looking to expand the frequency coverage of their radios, even for the flimsiest excuse. For those who are not professional RF engineers and techs: It is poor engineering practice to do this. And as Jeffrey pointed out in his message, price is no justification to do it. If you want to it as an experiment to learn - then do it. But remember that performance may not meet industry standards.

>73,
>Bill K0OWO

A "freebander" a pirate station that carries on 2-way communicaitons with other such stations outside of the ham and CB bands. They're found between 11 and 10 meters, from 27.405 to 28.000 Mhz. 7.415 Mhz was a popular hangout for freebanders a few years ago, as well as shortwave pirate broadcast stations. I believe the term comes from the fact that they operate in free portions of the spectrum that aren't occupied/allocated by any legal station or service.

a pulver.com conference

"The Voice of Telephony on the Net -
shaping the VON industry since its inception"

SPONSORS: Microsoft * Compaq * Lucent Technologies * Intel

April 1-2 April 3
Conference Workshops

WHO SHOULD ATTEND?

CEOs, Presidents and Managing Directors of companies implementing VON technologies; PTTs, PTOs, RBOCs, LD/IXCs; Internet Access/Service Providers; Telecommunications companies, resellers; software companies; PC manufacturers; Venture Capitalists, Investment Bankers, Management Consultants.

KEYNOTES: April 1 & 2 include:

Vint Cerf, MCI Telecommunications
David Farber, University of Pennsylvania
Ron Vidal, MFS Worldcom
John Ludwig, Microsoft
Mike Po, Netscape
Joe Mele, President, elemedia
George Favoloro, Compaq
Neil Starkey, DataBeam Corp, IMTC
Colin Harrison, IBM Zurich
Denis Aull, Lucent Technologies
Mark Fisher, Pacific Bell
Scott Adams, creator of Dilbert

BREAKOUTS: April 1 & 2 include:

Internet Telephony Forum

Review of Current Technology Issues
Effect of Internet Telephony on Business

NextGen Telephony
Fax over IP: Corporate Internet Solutions
Patents & Speech Coders
Internet Telephony & Consumer Entertainment
Business Opportunities

Webcasting

Streaming Technologies & Trends / Issues
Developing Audio/Video Content
Realities of Net Broadcasting
Content Push/Pull: NextGen of Content Delivery
Business Conferencing

Regulatory

Access Charges
Internet Telephony as a Global Norm?
Local Loop Alternatives: Promise or Reality?

WORKSHOPS - April 3

Post conference workshops will be offered to conference
delegates. See the website for additional details and fees.

LUCENT * COMPAQ * DATABEAM's H.323
* INTERNET TELEPHONY GATEWAY WORKSHOP *

HOW TO REGISTER (and for more information):

Dear Fellow Amateur,

An Internet Web Server devoted entirely to Amateur Radio and associated hobbies.

If you would like a home page of your own or for your Radio Club it's absolutely FREE and will always be FREE.

This is my private computer system with the Server on a T1 hi-speed network. It's a hobbie for me
just as Ham Radio is and I'm glad to share my system with everyone.

This is what you'll get:

E-mail account that you can use locally or have forwarded to your regular account

Example: K3TKJ@qsl.net , NE3Y@qsl.net , YOURCALL@qsl.net

FTP privleges

Telnet privlege (after you convince me you need it)

Your own personal Web site....Try these working pages now.

http://www.qsl.net
http://www.qsl.net/k3tkj
http://www.qsl.net/kc8eds
http://www.qsl.net/ve7fym
http://www.qsl.net/n3wdl

Here are the rules:

1) NO COMMERCIAL USE!

2) I'm not going to write the page for you. Isn't it time you learned something new?

3) You have an Amateur License.

That's it.... If you want to try it signup at http://www.qsl.net

Need more info? E-mail: k3tkj@qsl.net

73,

Al Waller K3TKJ
Laurel, Delaware

>the
>past

You mean the "(tech+ for 20+ years)" (see above) that I place *after*
your sig? That's no forgery or alteration, Carl. If I place a ">" prior
to it, then it certainly would be an alteration.

I append it due to your strange attempt to associate code ops with folks
who don't know how their radios operate, yet you claiming to be a state-
of-the-art engineer still hold an entry-level license after two decades.
I'm not the only counter-example (code op and builder) to prove your
claim false; most of the guys on the QRP list are also in that same
catagory.

You still haven't answered my long-standing question: What radios do
you operate on the air that you've built yourself? No fair scolding
the amateur community for not building if you yourself don't build.

Speaking of altering posts, why is it you alter my headers? You
constantly delete the "Followup-To: rec.radio.amateur.policy"
line I add to my header. Bad boy.

>73,
>Bill K0OWO

Hi Bill - They're CBers who illegally operate in the "no man's land"
between 11 and 10m, using altered amateur or CB gear. My freq'y
chart shows:

26960 - 27410: Citizens band
27410 - 27540: Land mobile
27540 - 28000: Government

so if they had any intelligence they'd remain well below 27540.

The major problem for us is that they spill out onto 10m.

They also "freeband" elsewhere on HF; years ago there was talk
on rec.radio.cb of large numbers using 5 MHz frequencies; the
frequencies one fellow had advertised happened to also be the
over-water air-to-ground aircraft channels. He seemed to be
offended that anyone would dare tell him he couldn't/shouldn't
operate there. (Are you listening, Drew? Do you still think of
these guys as your heros?)

73,
Jeff KH2PZ

William L. Fuqua III wrote:
>
>Freebanders are outlaws. They violate the laws of our country and most of the >thrill they get is from realizing that they are getting away with it.

Wrong. They do it because they desire serious communications no longer available on the "standard" CB band, yet they see no reason to submit to the Morse hazing ritual in order to get a ham license. Also, many of them wish to avoid what they perceive as "cliques" and "stuffyness" which they associate with amateur radio. Very few them make the investment of hundreds of dollars in radios, amps, antennas, etc., just for the "thrill" of "getting away with it."

>Yes, there are a few hams that do not behave well and
> should loose their license.

Quite a few, judging from what I've been hearing on 75m and 14.313 over the past few weeks. I don't know how anybody could listen to these fine members of the amateur radio fraternity night after night and then turn around and condemn the freebanders. Would be hard to keep a straight face!

>Freebanders do not provide any services for their
>country or their community

What "services" are they supposed to provide? Do GMRS users provide "services?" Do VHF marine operators provide "service?" Do Family Radio Service operators provide "services?" Of course not! Neither do the MAJORITY of amateur operators today; only a small minority continue to participate in ARES/RACES and similar services to the community.

>and only interfere with legal operations. They have no standards for their
> equipment or for station operations.

Largely untrue. There are a select few who, admittedly, bootleg their modified radios on 10 meters. There are also a few who run their amps wide open and splatter all over 10 meters. But there are "bad apples" in every bunch. Some of these guys on 75m are reportedly running about 8,000 watts of illegal power and splattering all over the band. The majority of freebanders have enough knowledge and common sense to operate their radios correctly and are extremely careful not to cause interference to nearby ham operators. Again, we're not talking about someone buying a Cobra 19-Plus for $35 at Wal-Mart here; by the time you've invested hundreds of dollars in a decent freeband station, most operators have enough knowledge and respect for the radio to operate it correctly.

>In fact they often screw up equipment.
> I bought a FT-707 (a 100 watt HF transceiver) sometime ago

> produce splatter for hundreds of KHz. The output meter
> calibration pot was set to indicate it was producing
> 200 watts output.
> I repaired it and sold it to young a beginning ham
> for less than I had paid for it.

Again, there are a few bad apples...and no shortage of "golden screwdrivers" out there. There are also a lot of freeband stations that have been set up correctly by licensed technicians who hold commercial and/or amateur licenses!

> Freebanders are a dangerous lot and if I ever locate
> one in my community I will report him even if he has
> a ham license.

With all due respect, what are you going to do about it? The FCC could care less these days. Unless someone's running 5KW out of their house and interfering with commercial broadcasters or some Congress-critter's television reception, the chances of them even being CONTACTED by Uncle Charlie are between nil and none. Here in Orlando, there are several kilowatt-plus CB stations who congregate nightly and use 26.815 for a "home channel." They've been there for years, every night, loud and proud. Nobody cares. We also have no fewer than THREE FM pirate broadcasters in town. One even puts their address and phone number in the YELLOW PAGES. Again, nobody cares. I work as a commercial broadcaster; I know for a fact there have been SEVERAL complaints by the well-funded broadcasters whom these illegal pirates are competing with, yet nothing happens. If the FCC isn't concerned with them, they certainly don't give two you-know-whats about 11-meter freebanders.

>In fact, it is worse if the freebander is a ham.
>Then he is a ham operating out of band the band limits.

We can agree on that much, at least. Which brings up another interesting question that I've always wondered...since the majority of freebanders are now using modified "amateur radios" (2510, 2950, Emperor, etc.) and so-called "wideband amateur HF amplifiers", why are they always referred to as "illegal CB'ers", "CB outbanders", or "bootleg CB'ers?" Would they not be more appropriately described as "bootleg ham operators?"

Ham Radio Online at http://www.hamradio-online.com is the world's leading amateur radio web site, read in 63 countries around the globe.

If you have not checked us out, stop on by and enjoy. There is always something new. We probably have more Amateur Radio "content" (articles, news, propagation reports and charts, disaster communications situation updates, photos and more) than any other Amateur Radio web site in the world. Hundreds of articles in the archives.

If you've been by, check on back and see what's new. We do updates every few days, sometimes every day depending upon our time.

We run Ham Radio Online as a self-funded, no ads web site devoted to radio communications and telecommunications topics. In spite of our professional appearance, we run the web site as a hobby.

I have posted a web page which lists some frequencies in Fort Collins,
Colorado to monitor.

http://holly.ColoState.EDU/~drranu/freqs.html

Also, from a recent road trip, I have a list of 2m repeaters between
Fort Collins, CO and Saint Louis, MO via I-25 and I-70 for anyone
else's up and coming road trip.

http://holly.ColoState.EDU/~drranu/i-70rptr.html

[Thanks, Eric viking@add-inc.com

Eric:

There is NO code requirement with CAP communications. There are
minimum requirements that any licensed ham should have no problem
passing, a test primarily having to do with operating procedures and
SOI.

CAP communications are on HF, VHF and Aviation bands, in voice and on
Packet.

CAP, as part of the Air Force, is regulated by NTIA rather than the
FCC. CAP traffic is not carried in the ham bands, even by licensed
hams, as part of that separation of powers.

In addition to the test, you also of course must be a CAP member.

Find out more by checking out the Web page (www.cap.af.mil), which
have a a Unit Locator to help you find your closest squadron.

I work at the Kansas City Assembly Plant for ford. We build Ford trucks f150 and the contour. The computers that are installed are in RFtight enclosures. In other words the computers are shielded from rf with aluminum boxes that are rf tight and would be very surprised if the transmitters would effect them in anyway.

Well said, and charitably too. In fact, I question whether the pro-coders really believe that Morse Code will ever play much of a role in emergency communications. After all, it never has. I have participated (as a bit player only) in emergency communications both on HF, VHF, and as a member of the Armed Forces. Never, not once, not one time, was Morse Code ever used. The best the pro-coders seem to be able to come up with are anecdotes about WW2 ships at sea (ships are abandoning Morse), old chestnuts regarding Vietnam POWs tapping messages on their prison walls (it wasn't Morse, by the way), and scenes from Independence Day (where Extra Class hams save Earth from Alien invasion using "old Morse Code."

Name me one time, one disaster net, where CW was actually used in the
fashion you describe. You try to compare Morse Code to CPR. But CPR is
used somewhere, effectively, every day. Morse Code is used so seldom
for disaster communications (never, in my 30 years of hamming) that its
adherents can usually not name one time where it was ever used for
anything except recreation by hams. Non hams, in recognition of this,
have just about 100% abandoned Morse.

A.N.A.R.T.S. News Bulletin 944 2 February 1997

ANARTS MEETING

There will be a meeting of the Society next Friday evening at

7.30 pm in West Lane Cove. Items to be discussed include the

Wyong Field Day and possible problems in disseminating news of

the ANARTS Worldwide RTTY Contest with news of the demise of

two magazines in the digital field - the Digital Journal and

SARTG Newsletter.

Come along and share your views. Contact Col VK2CTD QTHR or ring 9427 0530 a/h.

Silent key

I have been advised by Glen vk6iq that the highly esteemed member of our RADIO AMATEUR OLDTIMER GROUP Passed away Monday night at approx 7-00 p.m. R.I.P. Fred your many years of PAIN are no more..

The Funeral notice will appear in Thursdays West Australian Newspaper giving FULL details of the arrangments. Present information to hand is that it will be a Burial Service at Karrakatta Cemetery Friday afternoon , as yet the time has to be determined .

All VK6 R.A.O.T.C. Members and Friends are requested to attend and pay their last respects to one of our Radio Pioneers and a FRIEND to all who new him .

Vale VK6FH. De Clem VK6CW.

Col's Column

This week we continue with the ''Early Telegraph''. Starting with a giant, Joseph Henry. His story is quite a long one and it will probably take 3 or 4 weeks to relate. These early experiments fascinate me, without them we would not now be getting excited about the Heard Island Dx-expedition and the like. If you miss receiving the cast any Sunday and miss these notes, make sure you catch it on Packet Radio addressed to RTTY at VKNET.

Joseph Henry was a cultured and unassuming man who carried out some remarkable experiments of great value to the Telegraph

and indeed to Electrical Engineering. Henry has been pretty much neglected by Scientific Historians, even in America, his own country. This despite the fact that his work was successful and of the greatest value. He did not patent any of the apparatus he developed and was reluctant to publish the results of his experiments. Because he delayed publishing his work on Electromagnetic Induction, he was beaten to it by the Englishman Michael Faraday, thus losing for American Science the great honour of this fundamental discovery.

In 1826, henry witnessed a lecture by J.F. Dana. The lecture concerned an electromagnet constructed by William Sturgeon (England 1783-1850). The magnet fired Henry's imagination and he condtructed an improved model with increased magnetic power. He insulated the wire, instead of the Core as Sturgeon had done. In this way he was able to use many closely wound turns of wire in several layers. Henry wound the wire at nearly right angles to the core, thus utilising the magnetic field of the current to the full. He exhibited his electromagnet at the Albany Institute N.Y., where he was a Professor. His experiments with this apparatus was not published till 1831.

Finally for this week, to provide power for his equipment, Henry carried out experiments with batteries consisting of many cells in series, that is, he connected Zinc to Copper, Zinc to Copper and so on, the 'free' Zinc and the 'free' Copper in the two end cells being the terminals of the battery. We now know that such a battery has a high voltage and a high resistance, Hentry called it an ''Intensity Battery''. On the other hand he tried using a single cell in a big container with one large copper and one large Zinc plate. This he called a ''Quantity Battery". We now call it a low-

volage, low resistance cell. These batteries had a profound influence upon the Telegraph both in America and in Europe. Thats all for this week, the next episode gets a little technical, so you have one week to brush up on Ohms law, (and me).

73s DE Col VK2CTD.

MEMORY IN MINIATURE

A new substance that could multiply computer memory 100,000 (one hundred thousand) times has been discovered by scientists. the find concerns the behaviour of a Molecule sized magnet created from Manganese, Oxygen, Carbon and Hydrogen. If scientists can devise a technology to read and write from the tiny magnet, it will create the basis for a data storage unit one molecule in size. using magnets the size of molecules, it is theoretically possible to store hundres of gigabytes of data in an area no larger than the head of a pin. The announcement was made by researchers at the University of Barcelona, Spain on 28th Jan 1997.

>From the Sydney Daily Telegraph, Weds 29 Jan 1997.

IPS WEEKLY SOLAR AND GEOPHYSICAL REPORT

(24 JANUARY - 30 JANUARY)

ISSUED ON 31 JANUARY 1997

SUMMARY

Date 24 25 26 27 28 29 30

10cm 74 73 74 74 73 75 74

A 4 7 15 18 20 8 (8 ESTIMATED)

T 14 16 14 -22 20 -32 -4

SOLAR ACTIVITY WAS VERY LOW ALL WEEK.

THE GEOMAGNETIC FIELD AT LEARMONTH, W.A. WAS QUIET FROM 24TH JANUARY UNTIL 1000 UT ON 26TH WHEN MINOR STORM LEVELS WERE REACHED, UNSETTLED TO ACTIVE ON 27TH, UNSETTLED TO MINOR STORM ON 28TH, REDUCING TO QUIET TO UNSETTLED ON 29TH. cONDITIONS INCREASED FROM QUIET TO ACTIVE ON 30TH. THERE WERE SHORT PERIODS OF SPREAD F ON ALL DAYS EXCEPT 29TH, WITH SOME SPORADIC E OBSERVED ON 26TH.

FORECAST (31 JANUARY - 06 FEBRUARY)

SOLAR: VERY LOW

GEOMAGNETIC: MAINLY QUIET, WITH UNSETTLED TO ACTIVE PERIODS POSSIBLE DURING 5TH TO 6TH FEBRUARY.

FREQUENCIES: NEAR PREDICTED MONTHLY VALUES.

Courtesy IPS Radio and Space Services.

notes of Interest:

ST. PETER & ST. PAUL ROCKS, PY0 - The RTTY equipment sent by Randy, WX5L, to Karl, PS7KM, has been received, Karl has hooked it up to his TS-50S and checked it out on the air with VP8CKN. The DXpedition will arrive at the Rocks around 5 February after a 4-1/2 day boat ride.

Karl, PS7KM, will operate as ZY0SK on SSB/RTTY. QSL to CBA.

Tino, PT7AA, will operate as ZY0SG on CW. QSL to CBA. They plan to stay on the island 2-3 weeks.

The VK2SG RTTY DX NOTES are also available on Internet at reflector digital-dx(at)st.rim.or.jp . See also the OH2BUA WebCluster at URL http:www.clinet.fi/jukka/webcluster.html

The Ohio/Penn Dx PacketCluster

DX Bulletin No. 289

OH0, ALAND ISLAND. From January 31st through February 2nd, OH1NX, OH1NYP, OH1TX and OH2BH (returning from his XX9TR operation this past weekend) will activate OH0NYP on 160 meters. The variety of other callsigns may be heard on the higher bands. The 160 meters station will transmit 1825 kHz, especially focusing on the JA and U.S. openings.

Also, members of the Contest Club Finland will be working CQ 160 Meter Contest as OH0AM from Aland Islands. They are especially looking for the USA and Japan with their new antenna. Operators are OH1EH, OH1MDR, OH6EI and OH6YF.

Outside the contest, Harry, OH6YF, will be looking for the WARC band QSOs as OH0MYF.

COMING EVENTS

FEBRUARY 8-9TH CQ WW RTTY CONTEST

Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065

Australia, for such matters as membership and general

enquiries. Enquiries can also be made by packet to the

President (Col) VK2CTD at VKWI2, or the Secretary (Pat) VK2JPA

at VK2WI.

A.N.A.R.T.S. News Bulletin 945 9 February 1997

COLS COLUMN

YOU WILL RECALL LAST WEEKS EPISODE REGARDED JOSEPH HENRYS
EXPERIMENTS WITH ELECTRO MAGNETS AND 'INTENSITY' AND
'QUANTITY' BATTERIES. HE CONNECTED A LARGE SINGLE CELL
'QUANTITY' BATTERY TO AN ELECTRO-MAGNET THAT HAD JUST A FEW
TURNS OF WIRE. BECAUSE THERE IS LITTLE RESISTANCE IN THE
BATTERY AND IN THE WINDING A HEAVY CURRENT FLOWED, PRODUCING A
POWERFUL MAGNET, FOR THE HEAVY CURRENT MADE UP FOR FEW TURNS
OF WIRE ON THE MAGNET.

IF ONE HAD AMPLE SUPPLY OF WIRE AND INCREASED THE NUMBER OF
TURNS, THE CURRENT WOULD BE REDUCED DUE TO THE EXTRA
RESISTANCE OF THE WIRE. AS MENTIONED ABOVE THE RESISTANCE OF
THE BATTERY IS SMALL, SO ALL THAT WILL AFFECT THE VALUE OF THE
CURRENT IS THE NUMBER OF TURNS. IF THE NUMBER OF TURNS IS
DOUBLED THE CURRENT IS HALVED BUT THE STRENGTH OF THE MAGNET
REMAINS THE SAME.

THIS IS PRECISELY THE EXPERIMENT THAT HENRY PERFORMED.
REMEMBER WE HAVE THE BENIFIT OF HAVING LEARNT ELECTRICAL
THEORY, HENRY DID NOT. HE CONTINUED HIS EXPERIMENTS WITH A
HIGH VOLTAGE, HIGH RESISTANCE OR 'INTENSITY BATTERY' TO USE
HENRY'S WORDS. HE CONNECTED A HIGH VOLTAGE BATTERY TO A MAGNET
WITH FEW TURNS AND A HIGH CURRENT FLOWED IN SPITE OF THE HIGH

RESISTANCE OF THE BATTERY, IT WAS CAUSED BY THE HIGH VOLTAGE.

SAY A BATTERY HAS A RESISTANCE OF 200 OHMS WITH A VOLTAGE OF 50 VOLTS. IT IS CONNECTED TO A MAGNET WITH A RESISTANCE OF 1 OHM. BY OHMS LAW THE CURRENT WOULD BE 50 VOLTS OVER 201 OHMS. IF WE DOUBLE THE NUMBER OF TURNS ON THE MAGNET THE RESISTANCE IS DOUBLED, MAKING THE TOTAL RESISTANCE 202 OHMS. THE CURRENT WOULD BE 50 VOLTS OVER 202 OHMS, HARDLY ANY DIFFERENCE, LESS THAN HALF OF ONE PERCENT.

HOWEVER THE MAGNETIC POWER OF THE MAGNET IS ALMOST DOUBLED BECAUSE THE INCREASED RESISTANCE IN THE WINDING IS VERY SMALL RELATIVE TO THE TOTAL RESISTANCE. HOW FAR CAN WE ADD TURNS TO THE WINDING BEFORE MORE IS LOST THAN GAINED? HENRY'S EXPERIMENTS SHOW THERE IS LITTLE ADVANTAGE TO BE GAINED AFTER THE RESISTANCE OF THE WINDING HAS BECOME EQUAL TO THE RESISTANCE OF THE BATTERY. IN THE WORDS OF MODERN ELECTRICAL ENGINEERS 'THE RESISTANCE OF THE LOAD (THAT IS THE WINDINGS) MUST BE ''MATCHED'' TO THE RESISTANCE OF THE POWER SOURCE (THE BATTERY)'.

HENRY'S DISCOVERY WAS AND STILL IS OF THE GREATEST IMPORTANCE IN COMMUNICATION ENGINEERING AND NEXT WEEK WE SHALL HAVE A LOOK AT HOW AFFECTS HIGH RESISTANCE RECEIVING EQUIPMENT.

THATS ALL FOR THIS WEEK, STAY TUNED, DE COL VK2CTD.

ANARTS AT WYONG

ANARTS WILL BE THERE AT WYONG. COME AND MEET THE COMMITTEE MEMBERS AND ASK THEM YOUR QUESTIONS ON RTTY, AMTOR, PACTOR AND THE OTHER DIGITAL MODES WHICH ARE SO SUCCESSFUL ON HF (AND CAN BE USED ON VHF AND UHF AS WELL).

WE DO NOT KNOW WHERE THE STAND WILL BE, BUT WE WILL MAKE SURE THERE ARE SIGNS TO GUIDE YOU. COME AND VISIT US AT WYONG RACECOURSE OBN 23RD FEBRUARY ON THE OCCASION OF THE CENTRAL COAST AMATEUR RADIO CLUB FIELD DAY.

SOLAR ACTIVITY WAS LOW ON 2ND FEBRUARY, AND VERY LOW
OTHERWISE.

THE GEOMAGNETIC FIELD AT LEARMONTH, W.A. WAS QUIET, OR MOSTLY QUIET, ON 31ST JANUARY, 1ST AND 4TH OF FEBRUARY; QUIET TO UNSETTLED ON 2ND TO 3RD, AND 5TH TO 6TH.

FREQUENCIES WERE NEAR PREDICTED MONTHLY VALUES EXCEPT FOR A 30 PER CENT ENHANCED PERIOD DURING LOCAL NIGHT ON 6TH. SPORADIC E WAS PRESENT DURING LOCAL DAWN HOURS ON 2ND, AND SPREAD F WAS REPORTED DURING LOCAL NIGHT ON 6TH.

FORECAST (07 FEBRUARY - 13 FEBRUARY)

SOLAR: VERY LOW

GEOMAGNETIC: UNSETTLED 7TH TO 9TH, WITH A CHANCE OF ACTIVE CONDITIONS DURING LOCAL NIGHT; QUIET THEREAFTER.

FREQUENCIES: MOSTLY NEAR PREDICTED MONTHLY VALUES, WITH A CHANCE OF MILD DEPRESSIONS AFTER LOCAL DAWN ON

8TH AND 9TH.

Courtesy IPS Radio and Space Services.

VK2SG RTTY DXNOTES FOR WEEKENDING 31 JAN. 1997 (BID RTDX0131)

We surely must say tnx to all of VK0IR team for their effort and a special one to Peter, ON6TT for the rtty operation. Surely it has been a record, statistics say 80,673 contact with 2056 qsos on rtty during their stay.
It has been a busy week with the VK0IR operation; really each one must be happy I feel also the west coast guys. But look on sunday 26th it has been reported three different stations on the band all of them listening up; let us hope u have got the right one.....
Our thanks this week go to: ZS5S, W2JGR,WB2CJL, W5KSI, AA5AU, WX5L, KB2ZP, WS7I, ON4BX, PA0HVF, DF2KU, DL7AFV, IK1HSR,I2PKF,I5KG,I5IGQ, I1JQJ and the 425 DX gang, DJ3IW and the Central-Europe DX Cluster DB0SPC the NJ0M Node of Minnesota and the IK5PWJ Cluster.

NOTES OF INTEREST:

BARBADOS, 8P. AA4NC and K4MA will operate from 27 Feb. to March 4 as 8P9Z on all bands and modes including RTTY. Qsl via K4MA.

ST. PETER and ST. PAUL ROCKS, PY0. Randy, WX5L who has loaned the equipment for rtty, reports that Karl, PS7KM and

Tino, PT7AA will be leaving on 1st February. They hope to be qrv as ZY0SK and ZY0SG starting from 5 February for about two or three weeks.

The VK2SG RTTY DXNOTES are also available on Internet at reflector digital-dx(at)st.rim.or.jp. See also the OH2BUA WebCluster at URL http://www.clinet.fi/jukka/webcluster.html.

For next week's bulletin send your bandpass to Bob, WB2CJL at W5KSI.(hashsign)NOLA.LA.USA.NA.

Gl de (DX2) Luciano, I5FLN at ZS5S.ZAF.AF

ARLD007 DX news

This week's bulletin was made possible with info provided by Randy, WX5L, Michael, KO7V, Tedd, KB8NW, the OPDX Bulletin, Robert, KE2FB, Joerg, YB1AQS, and Contest Corral from QST. Thanks to all.

CAMBODIA, XU. Robert, KE2FB, is with the US Embassy, and is QRV as XU2FB. He works 80 through 10 meters, using CW, SSB, RTTY, and FM on 10 meters. QSL via N4JR.

BANGLADESH, S2. Hannes, DL3NEO, Mar, DL3DXX, and Joerg, DL8WPX/YB1AQS will arrive in Dhaka on February 2, and will be QRV as S21ZX and possibly S21XY. Activity will be on all HF bands, although emphasis will be on the low bands. QSL both calls to DL3NEO.

TURKS AND CAICOS ISLANDS, VP5. Steve, N9CK, will be QRV as VP5/N9CK from February 4 to 11. Activity will be mainly CW and RTTY. He will also be QRV during the WPX RTTY contest using the callsign VP5CK. QSL to N9CK.

The Ohio/Penn Dx PacketCluster
DX Bulletin No. 290. EXCERPTS

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, ARRL DX Bulletin, AD1C, K1HT, K3DI, K7BV, KO7V, W7TSQ, K8KS, N8BJQ, KX9X, DL8WPX, EA5KB, F5OZF, F6AJA, PS7AB and ZS5S for the following DX information.

S2, BANGLADESH. By the time you read this, Hannes/DL3NEO, Mar/DL3DXX and Joerg/DL8WPX/YB1AQS should have arrived in Dhaka. Mar and Joerg will stay until February 14th and Hannes until the 17th. Activity will be on all HF bands (sorry NO satellite operations this time). A 20m/66ft Titanex vertical and beverage-parts will be in their luggage. Also included

will be a RTTY modem and other antennas such as a R7, R-7000
and wires.

V2, ANTIGUA. Sean, KX9X, and Matt, NM9H, will be active from
February 12-19th, from the Caribbean super-station V26B. They
will be on CW, SSB, RS-12, and maybe RTTY.

COMING EVENTS

FEBRUARY 8-9TH CQ WW RTTY CONTEST

SAGEM TELEPRINTER PART WANTED

VICTOR VK3BVJ IS LOOKING FOR A 'MODULE BOARD' FOR A SAGEM
TX20 TELEPRINTER. IF YOU HAVE ONE OF THESE BOARDS FOR
DISPOSAL YOU CAN EITHER SEND A MESSAGE TO COL VK2CTD AT VK2WI
WHO WILL PASS IT TO VICTOR DURING THE SUNDAY CAST CALLBACKS.
OR YOU CAN CONTACT VICTOR VK3BVJ QTHR.

ALSO YOU COULD BRING THE MODULE TO THE CENTRAL COAST FIELD DAY
AND GIVE IT TO COL ON THE ANARTS STAND FOR ONWARD RELAY TO
VICTOR.

Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065
Australia, for such matters as membership and general
enquiries. Enquiries can also be made by packet to the
President (Col) VK2CTD at VKWI2, or the Secretary (Pat) VK2JPA
at VK2WI.

INTERNET RADIO-INFO-DIST AT UCSD.EDU

QSL cards can be obtained by :

applying to the Broadcast Officer at the above

address with station identification, bulletin no., date

and the first news item or part thereof. In

Australia include s.a.s.e., if overseas include 1 IRC

for air mail.

Views expressed in this news bulletin are not necessarily

those of the Broadcast Officer, the Relay Officers, or of the

Society.

A.N.A.R.T.S. News Bulletin 946 16 February 1997

NEWS FLASH REFERENCE NEXT WEEKS CAST

NEXT WEEKS CAST WILL BE ON SATURDAY MORNING AT 0030 UTC DUE

TO THE CENTRAL COAST ARC FIELD DAY. THE SUNDAY EVENING CAST

WILL BE AT THE SAME TIME AS USUAL, IE 0930 UTC.

COLS COLUMN

THE CENTRAL COAST AMATEUR RADIO CLUB IS HOLDING ITS ANNUAL FIELD DAY ON THE 23RD OF FEBRURARY 1997.

A.N.A.R.T.S. WILL BE THERE AS USUAL. AT THE PRESENT TIME WE DO NOT KNOW WHERE WE WILL BE LOCATED, BUT WE SHALL PUT SIGNS UP FOR YOU TO FIND US EASILY.

THIS YEAR WE ARE PUTTING ON A VISUAL COMPUTER DISPLAY SHOWING WHAT A.N.A.R.T.S. IS ALL ABOUT. THE SHOW CONSISTS OF ABOUT 20 COLOUR SLIDES AND WILL RUN FOR MOST OF THE SHOW. I AM DOWNLOADING A FEW PHOTOGRAPHS FROM THE INTERNET SHOWING OTHER AMATEURS ACTIVITIES AT THEIR FIELD DAYS, ETC. I WILL RUN THEM OCCASIONALLY DURING THE DAY -- ESPECIALLY IF YOU ASK ME.

THERE WILL BE INFORMATION SHEETS SHOWING THE BROADCAST TIMES AND FREQUENCIES, AS WELL AS THE CURRENT A.N.A.R.T.S. OFFICERS WITH THEIR PAKET AND EMAIL ADDRESSES.

COME ALONG AND SEE US AND FIND OUT ABOUT OUR SOCIETY AND PICK UP A MEMBERSHIP FORM WHILE YOU ARE THERE. FEES ARE TEN DOLLARS A YEAR AND THE MEMBERSHIP YEAR RUNS FROM JULY TO END OF JUNE.

AS A CONCESSION FOR THE FIELD DAY, ANYONE JOINING AT THE SHOW OR SHORTLY AFTERWARDS, HAVING PICKED UP THE MEMBERSHIP APPLICATION AT THE SHOW, WILL BE CURRENT MEMBERS UNTIL END OF JUNE 1998. SO WHY NOT COME AND JOIN US AT THE FIELD DAY AND IN THE SOCIETY.

THAT'S ALL FOR NOW, AND NEXT WEEK MY COLUMN WILL RETURN TO JOSEPH HENRY.

73S FOR NOW DE COL VK2CTD.

IPS WEEKLY SOLAR AND GEOPHYSICAL REPORT

(07 FEBRUARY - 13 FEBRUARY)

ISSUED ON 14 FEBRUARY 1997

SUMMARY

Date 07 08 09 10 11 12 13

10cm 76 75 73 72 71 71 71

A 3 20 17 21 17 8 (4 ESTIMATED)

NOTES OF INTEREST:

SETTING RECORDS. Just a note on setting records. During Luciano's ZA1A operation. Alone on RTTY from 3-7 Oct. 1991, Luciano made 1328 QSO's. If you compare with those using better equipment and more operators, his QSO rate is still tops.

SAO TOME & PRINCIPE, S9. QSL S92JR, Frederico Fernandes, P.O.Box 173, Sao Tome & Principe (West Africa) via Portugal.

TN, CONGO. Baldur, DJ6SI, was active as TN6X, SSB and CW. No RTTY. Evidently Heinrich, DJ6JC our RTTY man did not participate. QSL Baldur to his home call DJ6SI.

SAINT PETER & PAUL ROCKS, ZY0. KARL, PS7KM will try to knock down the 8th most needed country on the RTTY list. Special Thanks to Randy, WX5L for supplying the team with a RTTY station. Karl, PS7KM and Tino, PT7AA will operate as ZY0SK and ZY0SG respectively. QSL operators CBA. At this point all spots on the clusters are SSB and CW, no RTTY as yet with many concerned.

The VK2SG RTTY DX NOTES are also available on the Internet at reflector digital-dx@st.rim.or.jp. Check also the OH2BUA Webcluster at URL http://www.clinet.fi/~jukka/webcluster.html

For next week's bulletin send your bandpass to Jules, W2JGR at W5KSI.#NOLA.LA.USA.NA

REMEMBER, DX DON'T SLEEP.

GL DE BOB, WB2CJL at W5KSI.#NOLA.LA.USA.NA

ARLD009 DX news - extracts

This week's bulletin was made possible with info provided by Tedd, KB8NW, the OPDX Bulletin, the 599Rpt, Dennis, K7BV, Jack, W1WEF, the DXNL, the Yankee Clipper Contest Club PacketCluster Network, and Contest Corral from QST. Thanks to

all.

GHANA, 9G. Steve, PA3GBQ, is QRV as 9G5BQ until early March. Lately, he has been found on 3514 kHz starting at 2200z and was heard as late as 2345z. QSL to PA3GBQ.

MINAMI TORISHIMA, JD1. JG8NQJ/JD1 will be here until April 23. His activity will be limited due to his work schedule, however. Look for him on 40 through 10 meters from 0100 to 0200z, 0600 to 0700z, 0930 to 1100z and 1300z.

ARUBA, P4. Look for P40W to be QRV in the ARRL DX CW Contest as a Single Op, High Power, All Band entry. Check 160 and 80 meters on the hour or half hour.

NETHERLANDS ANTILLES, PJ2. Jack, W1WEF, and John, W1BIH, will be QRV as PJ9C from Curacao as a Multi/Single entry in the ARRL DX CW Contest. Before and after the contest, look for PJ9/W1WEF.

ST. KITTS, V4. Alex, W2OX, will be QRV as V47KP from February 13 to early March. He will also be active in the ARRL DX CW and SSB, and CQ WW 160 Meter SSB, Contests. QSL via K2SB.

BURKINA FASO, XT. Dan, XT2DP, has been QRV on 80 meters around 3795 kHz at 2000z. QSL via WB2YQH. XT2AR is also QRV from Ouagadougou, and will be here until February 26. QSL via W4BYG.

CAMBODIA, XU. Robert, KE2FB, works at the US Embassy and is active as XU2FB on 80 through 10 meters. He uses CW, SSB and RTTY. He can also be found on 10 meter FM. QSL via N4JR.

Ohio/Penn DX Bulletin No. 291 -- Excerpts

Thanks to the Northern Ohio Amateur Radio Society, Northern Ohio DX Association, Ohio/Penn PacketCluster Network, W2GD, KB2PFP, N5FTR, NL7TB, KX9X, W0YG, EA3NY, G4BUE & DX News Sheets, G4ZVJ, JA3AAW, LU2BAR, LX1NO, PA3DMH, RA1QHJ and

9N2NOM/G3NOM for the following DX information.

3B8, MAURITIUS. The 'DX News Sheet' reports Adriano, IK2GNW, will be active from here February 20th to March 1st as 3B8/IK2GNW. Planned activity will be CW/SSB and RTTY, with an emphasis on 160 and 80 meters.

FS, ST. MARTIN. Eddie, EA3NY, plans to be active during ARRL DX SSB Contest, March 1-2nd. He will use the callsign FS5PL during the contest and a few days before. Eddie will be Single/Op on all bands.

V2, ANTIGUA (UPDATE). Last week we mentioned that Sean, KX9X, and Matt, NM9H, would be active from February 12-19th, CW/SSB and RS-12. But due to popular request, the team WILL also be active on RTTY from the Caribbean super-station V26B.

COMING EVENTS

FEBRUARY 23rd WYONG FIELD DAY - COME AND SEE US

SAGEM TELEPRINTER PART WANTED

VICTOR VK3BVJ IS LOOKING FOR A 'MODULE BOARD' FOR A SAGEM TX20 TELEPRINTER. IF YOU HAVE ONE OF THESE BOARDS FOR DISPOSAL YOU CAN EITHER SEND A MESSAGE TO COL VK2CTD AT VK2WI WHO WILL PASS IT TO VICTOR DURING THE SUNDAY CAST CALLBACKS. OR YOU CAN CONTACT VICTOR VK3BVJ QTHR.

ALSO YOU COULD BRING THE MODULE TO THE CENTRAL COAST FIELD DAY AND GIVE IT TO COL ON THE ANARTS STAND FOR ONWARD RELAY TO VICTOR.

Society information

The Society may be contacted at : PO Box 860, Crows Nest 2065

Australia, for such matters as membership and general

enquiries. Enquiries can also be made by packet to the

President (Col) VK2CTD at VKWI2, or the Secretary (Pat) VK2JPA

at VK2WI.

News items may be sent to Broadcast Officer PO Box 60

Blacktown 2148 Australia, or fax to (02) 9672-3392, or by

packet to VK2JPA at VK2WI.

After reading all this drivel I have come to the conclusion that you no-code advocates are just too lazy to make the effort to learn a new and valuable skill. Your attitude sucks! Instead of pissing and moaning like you do why not move down the band and have a contact or two. You may actually find that you will meet a better class of person, polite and courteous, indciative of the old-time spirit and fraternal aspect of the hobby that attracted you to it in the first place.

Five words a minute is not hard to learn nor will it take up too much of your time. I challange you to try it and have a few QSOs on CW! See how different things are at the lower end of the bands. Know of what you speak.

Otherwise you are no more than enhanced CBers, appliance operators with no appreciation for the wonderful privileges available to you. Just listen to the difference in attitude in the two band portions and then tell me that CW is useless! That is,if you can!

Actually the 9th graders do not need to hear my views. They have open
minds.
They are far more alive than most hams or ASDers.
I do not have a Packard Bell.

Michael,their is no longer any doubt in my mind that I am not worthy to worship at the Church of the Beepers with you and from your abouve quote I sure can detect the attitude difference between you and I.I have participated in your worship services before and they sure did put me to sleep very quickly.I would like to extend an invitation to you to visit our non-denominational hobbie anytime there are no beeper requirements and you can chat with people world wide with low power via satellite,we can even exchange mug-shots and our favorite cookie recipes using one of the digital modes or just chat and picture each other by our voices,wouldn't that be neighborly!We do not discriminate because of a persons race,creed,color or ability to beep.

What an utterly STUPID comment!
Why am I not surprised? <grin!>

BTW Burt (and everyone) could you please confine these pissing match posts to ONE RELEVANT newsgroup, such as r.r.a.misc?

When you cross-post to 12 different NGs where you are off-topic it really ENABLES Burt in his attempts to further erode the quality and character of the Amateur Radio Service that he is out to destroy.

I am still grateful to all of the HAMS and other people that DID have the guts to kick him off all of the moderated services where he has reared his ugly head, ush as FIDO AMATEUR, SHORTWAVE, BBSes and many other on-line services. I have watched him get eliminated one-by-one from these over the past several years by his anti-social behavior. One can only conclude that his divorce has left him wounded and bitter and that is why he behaves so immaturely and nastily, poor guy.

It seems that the Usenet system is pretty much an unregulated playground for bizarre personalities like him, so it may be that the only way we are going to get rid of him is to ignore him, or for one or two of those "gutless hams" up in the Cape Cod area to go pay him a visit like he says he wants!

A little attitude adjustment is in order here. Is Burt SO fossilized that he can't change? A pity really! I am sure that if he were in his right mind he would have much to contribute to his fellow amateurs.

Hello Michal: Why should us low life CB'ers study the code? To talk to
guys like you? I don't think so!

You should be telling us how wounderful the CW bands are how great the
fraternity of ham radio is, and welcome us with open arms, and offer us
help and assistance .... right?

Jay at jay123a@ptw.com .... A good friend to "Big Bob" famous CB'er

No, *your* attitude sucks ... you *want* to believe that everyone who
opposes the continuation of the Morse code "religion" is "lazy"
because it makes you feel "morally superior." Well you're NOT.

> You may
> actually find that you will meet a better class of person, polite and
> courteous, indciative of the old-time spirit and fraternal aspect of the
> hobby that attracted you to it in the first place.

What a pile of crap! ... a bunch of geezers pounding brass is NOT
what attracted me to ham radio over 20 years ago ... it was the
RADIO part ... the technology, the experimentation, etc.

> Five words a minute is not hard to learn nor will it take up too much of
> your time. I challange you to try it and have a few QSOs on CW! See how
> different things are at the lower end of the bands. Know of what you
> speak.

First, the bit about 5 wpm is intellectually disshonest ... 5 wpm only gets
you novice privs on HF ... which are so useless that 3 out of 4 novices
does
not continue on ... they quit ham radio in disgust.

Second ... most of us fighting against the code test are NOT "newbies",
but rather long-time hams who passed code tests, have used the code,
and come to the conclusion that mandatory code is bad for ham radio.

Many are even higher class licensees who like, use, even prefer CW as
an operating mode, but are sensible enough to realize that it's "not
everybody's
cup of tea" and that cramming it down everyone's throat is unreasonable,
unnecessary, and counter to the future survival of ham radio.

Third ... as Gary pointed out ... it takes so *damed* long to say anything
in Morse (even at 20 wpm) that it may tend to discourage a lot of arguing
in the CW portions of the bands ... however, there's still a lot of strings
of

dits, swooshing of carriers, "FU FU FU", etc. that's clearly analogous to
the jamming activities of the lids on 80m and 20m.

Please read the article "The Decline of Amateur Radio?" at the Ham Radio
Online web site: http://www.hamradio-online.com/1997/feb/opinion.html

> Otherwise you are no more than enhanced CBers,

You guys are CBers who beep ... it's the technical pursuits
that a ham make ... not the macho competitive games stuff
that the beepers and the ARRL have promulgated.

> appliance operators with no appreciation for the wonderful privileges
> available to you.

There is NO relation between learning/knowing CW and being an appliance
opearator ... most of the HF hams out there are, unfortunately, appliance
operators ... and they know the code ... the reason for the rise of the
appliance opearator is the availability of (reasonably) good gear at prices
people can (more or less) afford ... and the fact that you beepers, DXers,
and contesters have promoted the "games/competition/sport" aspect
to the point that you've perverted ham radio in to something other than
what it was intended to be ...

> Just listen to the difference in attitude in the two
> band portions and then tell me that CW is useless! That is,if you can!

Your attitude supports the contention that CW is *worse* than useless.

To paraphrase what others have written very eloquently of late, the code
and the ARRL are killing ham radio and we have to make some *drastic*
changes to overcome those "forces of evil."

Well ... I guess I'll have to be more careful with my posts ... I don't
want to be *too* charitable ... that could be misconstrued as "giving
aid and comfort to the enemy" ... and I really *do* view the pro-code
fanatics as "the enemy" ... (not *my* enemy ... the enemy of ham
radio's future survival)

Here's the scoop:

I have spent the last two months listing the underground sites the big boys would be ashamed to admit exist. Most of the good stuff on the Internet costs money. However, by going to the right places, the very same services can be found absolutely FREE! These superior sites are difficult to find because they don't have the budget to let you know where they are.

Here are a few quick examples of what you'll find on my list:

FREE WEBPAGES - http://www.webspawner.com
Generate your own webpage right on-line for free. No hassles, it's instant and EASY. This is the slickest site on the net! You heard it here first.

FREE STOCK QUOTES - http://www.stockmaster.com
Get realtime stock quotes without paying a subscription. They'll even generate a complex history graph for your stock on the fly! Check it out.

MASTER NO-SPAM LIST - Get yourself on the now forming universal spam remove list for free. I'll tell you how to sign up & ensure all major bulk-mail houses remove your name prior to any mass mailing. Really.

FREE E-MAIL - http://www.bigfoot.com
How about a disposable e-mail address for secret communicate with your mistress? It's free for the taking, log in and sign yourself up.

These examples are just the tip of the iceberg. To get the full underground scoop, forward this e-mail to: phoenix@openix.com

Be careful not to simply reply to this message, If you do, your message will remain unread. Once I receive your e-mail at the above address, I'll send you my complete report on the best free underground sites on the net. Read it, and gain the inside dope that only the savy netizen is privy to.

This notification is paid for by the non-
profit group of Citizens for a better net

Collen Farben & Staff
Working to bring out the best of the net.
(Non-profit sponsors welcome.)

Note: You'll not hear from me again, get your copy of the free report now.

Roger,
You misunderstood my position slightly. I am not n advocate for completely doing away with all code requirements. However, I am not an advocate for the code requirement as it is today. As I attempted to point out, the code requirement is a symptom of a larger problem with Amateur radio and that is that the current test pools are stuck in the 1960's. If you only require that level of knowledge to pass then the average amateur will have only that level of knowledge - it sets the climate for the entire amateur community. These tests are backwards looking - not forward looking. Despite the fact that I believe that code should not be a requirement all advanced tickets I also firmly believe code is not the main problem. It does, however remain our primary "PR" problem however.

A question rather than a solution (sorry!). I have a 95 Suburban and
have a noise problem, too, but don't know WHAT is causing it. Maybe it
is the fuel pump problem? What are the symptoms of the fuel pump noise?
My problem is spurious 'carriers' that come and go at different
frequencies. That is, after 2 or 3 minutes, a clear frequency gets a
'carrier'. Conversely, after a 5 to 30 minute period it FADES and goes
away! I thought this might be more related to the computer?? It occurs
in the 2M band and in the 150 - 160 PS band. Any ideas??

4351. Why I changed my mind on the code...

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-23 00:00:00 UTC
From: Bob Miller <bmiller@calweb.com>
Message-ID: <33109AF4.6920@calweb.com>
Source record: 203965

It seems that the arguments for and against the code will continue without end. Tis a shame that so much energy is expended on these endless arguments, but this is my ten cents worth..

That CW is a slow method to convey information is difficult to debate. This internet connection is not exactly a model of communications efficiency given the datagram mode of newsgroup traffic, yet no one seems to complain. CW is an emotional issue tightly linked to romanticism. It is in essence a rite of passage into ham radio or if you prefer a social filter much like a fraternity or sorority hazing. If you want to join, you must tender your social dues. It is a very simple concept. The international dictates requiring CW proficiency may have outlived their justification, but will the intrinsic amateur radio operator population let go of the attachment? Those who want in without benefit of hazing cite numerous technical issues as to the obsolescence of the mode and those who insist on the hazing cite numerous operational issues as well as some technical issues as to the need to keep the CW requirement. These arguments for and against the CW requirement tend to nullify the issue and miss the whole point. Is CW necessary to the well being of ham radio?
Since the very existence of amateur radio can be traced to romantic adventure and a machismo attitude among its members and members to be, CW could be regarded as the most rigorous venue among radio transmission modes. The biggest signal on the air and the best receiver that money can buy coupled with the highest antenna that can be erected will not mean a thing if the ham cannot decode the tiny signal from a 15 watt transmitter in Senegal. That is reality. You can argue that a good computer program and a nifty DSP filter could accomplish the task and win the debate. But the victory is a technical one and misses the entire point. Why not have the same pan intelligent process answer the ham in Senegal as well and take your participation out of the equation altogether?
And this is my small point in favor of CW. CW is nothing more than a small payment up front for an enormous payoff in future rewards. It has become the only mystery left in the grand amateur radio schema.. Why fight it? Savor it.

4353. Kenwood tmv7a question on crossband repeating

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-23 00:00:00 UTC
From: Ron Koppel <ronlois@telis.org>
Message-ID: <3310A00C.2861@telis.org>
Source record: 203967

According to kenwood's application note AAN009 the tm733 will bi-directional cross band repeat verses one way cross band repeat. Can the tm-v7a also bi-directional cross band repeat at the same time so 2 single band ht's (1 being 2m and 1 being 440) communicate by being repeated either direction. Ron Koppel, KF6IKZ.

4354. Feedback on Alpha 91B and QRO HF2500DX!

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-23 00:00:00 UTC
From: jsjones@intrlink.com
Message-ID: <5eookh$4r9@clark.zippo.com>
Source record: 203968

Still looking for feedback from Alpha 91B owners and QRO HF2500DX owners. These amps both have features that make them stand out on paper as one being better than the other but I am amazed that I have only recieved feedback from the QRO owners and none from Alpha owners on any models let alone the 91B which after you order there is a 16 to 20 week wait. I have heard that Alpha had a bad reputation as far as service goes, especially on back log of repairs. After talking with Dave Wilson of the new company called Alpha Power he informs me that the reports were true and that as of the last week of February that there repair backlog was all caught up and they were finally in their new plant and with the moving and setting up of the new company that it had created a very bad transition period for them which they are now finally getting back under control. I don't know if this is true or not and that is why I was hoping to hear from actual owners. I would appreciate any and all replies on either amp company but especially would like to hear from Alpha owners and owners of the 91B,

Golly, Michael. I'm an Extra Class ham, and was originally licensed in 1966. I'm also one of the more vocal proponents for ending the Morse Code requirement for HF privileges. Are you directing your comments at me?

Posts like yours, that attack the arguers rather than the arguments, are not productive, and serve only to inflame tempers. Why don't you stick to the arguments rather than make personal comments against those with whom you disagree?

For the record, I don't view Morse Code as a valuable skill. It is a recreational skill, and it is nice that some people still enjoy it. But it is never used by amateurs in emergency communications, and has been abandoned by essentially all other radio services. It is an anachronism.

Dana...

The more I read your material trying to "worm-out" of the hole you placed yourself into, the more it is becoming apparent that you are not very apt in engineering or RF work at all. It is useless at this point to continue a debate with you - since you are always right in everything you do, even when you are wrong. It's no wonder why hams have no access to much of the commercial radio sites. Think about it...

To all Ham radio operators,

I am putting together a collection of ham radio stories, like what is the best thing that has happened to you or someone you know that involves ham radio. What is your favorite story?

Best Field day
Your Elmer
The Best Christmas (radios, ant., contacts,)
DX
Antennas (what you've used and how it worked)
What you used as a kid in Ham Radio
Those hours of dreaming while looking through Lafayette, Allied etc.catalogs
What it was like 10,20,30,40,50...years ago

This is your chance to tell your story. I hope to put together a book and if so I will keep all contributors notified.

Thank you for your time and effort.
Please Email me direct.

This is what the urban legend is,... but I just don't believe it. Type acceptance has alot more to do with who will be using the radio rather than its performance.
Remember; ham operators have to take a test (and presumably know something) and are individually licensed. Business radios users are not licensed, the business is. Marine radio licenses are similar. One of the criteria for type acceptance of business radios is that they not be easily field progammable. Remember, the users are unlicensed and often untrained.

Just my $0.02.

You're assuming that these radios were not designed to cover large
frequency ranges. How do you know?
Perhaps they were, specifically to cover many product lines, then software
(or hardware) restricted to the range under which its sold.

I wrote you no email on this subject. Absolutely none. Telling the
truth is also part the the responsibility of free speach. Spamming is
sending this crap to a huge number of news groups. By the way I trimmed
the groups some.

>speak.

And what is the challenge you put to me?

>Otherwise you are no more than enhanced CBers, appliance operators with no
>appreciation for the wonderful privileges available to you. Just listen
>to the difference in attitude in the two band portions and then tell me
>that CW is useless! That is,if you can!

I have and find the two remarkable different just in
what CAN be discussed in the same time frames.
Frankly, my life and time finds CW painfully slow in terms
of information per minute.

And yet, as Carl notes above, we are all expected to belive
that there is and can be some global catastrophe of such
monumental consequences that the ONLY mode available
to resume communications is morse code...AND that all
the world's commercial, military and govenmental communications
will be unusable....BUT amateur radio will be there with
CW to save the day.

I could at least buy aneed for minimal morse code knowledge IF
there was any reasonable expectation that it did and would on
occasion be a life saver. It simply hasn't lived up to that at all.
Indeed, we'd be better off requiring all hams to learn CPR rather
than Morse. Odds are far greater that knowledge of CPR would
be used to save a life of a ham and others on a regular basis.

>adherents can usually not name one time where it was ever used for
>anything except recreation by hams. Non hams, in recognition of this,
>have just about 100% abandoned Morse.

Not only that, but the morse proponents apparently make no effort
to form any type of real emergency net capability yet they expect
everyone to belive they can just pickup the pieces after some global
disastor and have communications humming along. They never
say anything about all the hams who actively particpate and support
emergency communications capability today. They never acknowledge
the extensive emergency operating capability that the emergency
oriented hams have already. The code proponents have the same
equipment as everyone else yet they keep claiming they'll be
there in the clutch. That assumes all the current emergency
(RACES, etc) folks have been blown away by the feared
global catastrophe.

And, adding to the NON hams comment about abondoning
morse code. I think it is true that non-hams have 100%
abandoned morse with regard to any and all communications
in North America.

4372. Re: Which dipole to use??

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-24 00:00:00 UTC
From: Lee <rfi@voyageronline.net>
Message-ID: <01bc2202$11983d00$497e80d0@default>
Source record: 203777

I use an all band dipole made with 12 gauge insulated wire and fed with heavy gauge 450 ohm ladder line. My friend W4BOB and myself made it in about 20 minutes. It does an excellent job and is the only HF antenna I have. My rig is a Kenwood TS50 and I have no amp. Just look at the scores for KR4ND in SSB contests (a few CW) over the last couple of years such as the November Sweeps, WPX, ARRL International DX, etc. if you want to see what I've been able to do with this modest set-up.

Stan Swizdor <swizdor@auburn.cayuga-cc.edu> wrote in article <5eqjel$b5d@snowball.hscsyr.edu>...

>
> Ideas, anyone?

Call Universal or EEB (1-800-431-3939 or 800-368-3270) and ask them what
they suggest for a lightning arrestor. I know that Alpha Delta makes a nice
one called the LT that goes for $20.95. Basically, it uses a hermetically
sealed
gas filled cylinder which allows an arc to form when the vertical element has a
high voltage applied to it. Once the arc forms, the resistance between the
center conductor and ground will be negligible, and most of the energy will be
directed to ground (use a good ground rod & heavy copper cable to connect
the arrestor to ground)

I would still recommend disconnecting your shortwave receiver when it is not in
use.

Hope this helped,

Steve

Message-ID: <331136f3.3634428@news.imaxx.net>
Source record: 203781

Are you reading this? Great! That means it wasn't written it for nothing. Not to worry, you won't be wasting your time.

Amateur Radio is a hobby and like all hobbies, it needs to be fun and rewarding. We at FBOM Magazine may not be able to straighten out your 40
meter beam after a hurricane or stop commercial satellites from squatting
on your VHF repeater input, but what we can do is present a lighter side
to all the QRM.

FBOM Magazine is the new generation of radio hobby publications, focusing
mostly on amateur radio operators (Hams). FBOM Magazine is for everyone,
from the guilt-ridden Extra class ham to a Technician or CBer that's tired
of being blamed for the erosion of family values in America. FBOM Magazine, the official publication of the Bad Signal Club--A free-thinking
state of mind where you are certified to transmit scratchy signals, crack a
joke without saying "hihi," tune up on some Little LEOS and have a good
time laughing at others as well as yourself.

As if that wasn't enough, FBOM also pokes it's nose into the world of the
scanner junkie and the strongest competition to wireless communications,
the Internet.

*
* GET YOUR FREE SAMPLE ISSUE!!!
*
* Email N9VJG@aol.com now for your free sample of the latest issue!
*
* Visit our Web Site which is still under construction and
* in bad need of updating. Just nudge your favorite browser to:
* http://www.interaccess.com/uncle-del/FBOM/.
* If you have America Online, visit the FBOM Magazine folder
* in the Ham Radio Forum message boards, under "Manufacturers,
* Dealers & Vendors."
*

Why YOU should subscribe to FBOM Magazine:

1. You will earn your official Bad Signal Club membership and will be
able to operate any bands with a scratchy signal and tell the
complainers
to stick it where the sun doesn't shine.
2. Blatantly hilarious and unusual commentaries on life as a radio
hobbyist.
3. No boring propagation charts. We replaced those with "Radio
Horoscopes".
4. No articles for home-brewing outrageous tri-banders and RF amps.
Just
step-by-step guides on how to build contraptions like a
"rubber-duckie
plane" for your HT and how to clean nasty things out of your
microphone.
5. Wacky contests where you can win antennas, free chunks of used
RG-58
and other prizes.
6. Free classifieds for paid subscribers.
7. We don't make you feel inferior if you work channel 19.
8. Hey.. we're writing it, so why aren't you reading it?
9. FBOM is 100% biodegradable and fat-free!
10. No test is required for this upgrade.

Why YOU should subscribe to FBOM Magazine NOW:

Rates are CHEAP! 2-year (4 issues) subscription rate of $9. 1-year
subscription rate (2 issues) for $5.

For only $9 you can have 4 issues of FBOM Magazine delivered to you.
Hey
that's a pretty good deal--especially for a publisher that is terribly
desperate to gain more subscribers!

How you can give us your hard-earned money:

*
* Mail a check or money order for a 1 or 2 year subscription to
* "Eric Bond" (That's me, the publisher and janitor) and send it
* to FBOM Magazine, P.O. Box 7711, Westchester, IL 60154-7711.
*

(FBOM Magazine c1997)

>tonight. The topic of tonight's battle was "WHO'S JAMMING WHO?"
>Donnie was blaming Polly for Al's actions and behavior on the
>frequency. Polly then blamed Donnie for blaming Polly for jamming
(snipping inane bullshit for brevity:)

Let me ask you a serious question. Why do you listen to these clowns? I tune around on 75 meters as well as just about anywhere else, and can always find more interesting things to listen to than these ignorant rednecksand their stupidity. For all of the bullshit spewed by these guys and 14.313,
one can find many interesting things to do with a receiver and a free evening. Why must you, 1. Listen to this trash, and 2, tell the world about it in the newsgroups.

Also, do you think we really give a shit what your cb call is?

I've had a cb eradio in the car for emergencies off and on the last few years, but don't admit it to anybody, and don't really expect to get anything intelligent most places if I do yell for help on channel 9.
C'mon dude, there's got to be better listening on your hf radio than this stuff.
It's a blight on the hobby to be sure, but we've got them in any avocation or business.
Exercise your right to use the two most important controls of your radio, the vfo and the on/off switch.

> quite frankly, I have found very few if any locally who will agree with
> anything you have to say concerning amateur radio

Of course no one else will dare risk losing access for displeasing King
Steve.
I have been locked out of several PBBSes and the few that allow me in
get a lot of pressure to take me off but they are real men, they do not
like what I say but they believe in free speech.

> I also reserve the right to preview all for sale messages for content. I

That's not very surprising. If you were a licensed amateur you would
(or should) know that there is no type acceptance protocol for
amateur transmitters, only for external rf amplifiers. Testing on
knowlege of these regulations is a part of the licensing procedure.

There are technical specifications for bandwidth and spurious
emissions, but these are the responsibility only of the control
operator. There is no requirement for any testing, registration or
labeling by a manufacturer or importer, aside from compliance with
Part 15, when applicable.

On or off the amateur bands? I guess it doesn't matter - a distress
is a distress no matter what freq'y you're on. With that in mind,
CW has played *the* major mode of choice for distress communications
on the high seas for a glorious 80+ year period. Not voice, not RTTY,
but CW. *The* disaster net of this century was held on 500 kHz from
sundown to sunrise, and on 8364 kHz during daylight hours. It worked
flawlessly. Equipment and procedures were simple. Hopefully what
replaces it will work as well.

73 from the Central Pacific,
Jeff KH2PZ

As stated before, anyone who wishes access may have it. All I ask is that the information posted or passed be amateur radio related. I have no problem with those that wish to use it. There are literally dozens of other PBBS's in the NNJ area, so those who are not satisfied with my requirements are free to go somewhere else. Essentially, my PBBS is a test bed (with several others) for passing information at speeds other than 1200 or 9600 baud.

> I have been locked out of several PBBSes and the few that allow me in

I believe in free speech as well. HOWEVER, I do not believe that anyone has the right to force me to allow them the platform to practice it. What you suggest is that I am compelled to allow a racist amateur radio operator to post his skeds on my PBBS. I think not.

My PBBS is linked to dozens of NNJ PBBS which in turn are linked to 100's
in the surrounding states. To think I can know all who access my system
is incorrect

4397. Help Needed On 30L-1

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-24 00:00:00 UTC
From: hoff@america.com
Message-ID: <5es3ht$777$1@defiant.america.com>
Source record: 203802

Maybe some of you 30L-1 experts can help with some questions.

I'm trying to restore a 30L-1 for my station, but the manual gives no procedure for setting R16 the ALC pot or C18 the capacitor that sets RF feed back. Does someone have a procedure for doing this that they can share with me?

At the junction of R12 and R28 on the relay coil there is a diode to ground. It's not in my schematic. Can someone tell me if it belongs there.

The relay in my amp is a Potter & Brumfield KA11DG. Based on the picture in the manual I just got, it does not look like the original. Has anyone had any experience with this relay? Or should I try to find one like the original?

Resistor R28 in the Ant Relay line is 34 ohms. My schematic says 56 ohms. Did Collins use different values for this part and if so how should one determine what the correct value should be?

Someone told me R12 the resistor across the relay should be 3000 ohms. Mine is 2000 ohms and thats whats on the schematic. Did Collins use different values? Or is the schematic correct?

All help will be greatly appreciated

Commercially manufactured amateur radio equipment (i.e. produced for resale) does in fact carry type acceptance. Take a look at the back of most radios, for instance my FT40 (yaesu), and it has the FCC ID (type acceptance) K66FT-40R and even a canadian type 511 101 525A. If you don't think the FCC regulates the commercial amateur equipment line, suggest a trip to Japan. You would love to have some of the "Amateur" equipment readily available in that country that is not imported to the US because they cannot be "type accepted". Now days, there are so many reasons for failing type acceptance that many radios never make it here. They may not have anything to do with "spectral purity", but the type is required. Home made stuff, no type needed, "yet"!

By the way, there is a perfect example for you that all the "type acceptance" crazies have for months discussed.

MOTOROLA, thats right, the big M, has manufactured a radio(s) that are Amateur Only called the AP50 and CP50. These are the same as their popular SP50 commercial radio, except they are keyboard programmable in the Amateur Bands. They are not available in the US (in theory) because they are NOT FCC TYPE ACCEPTED for amateur radio. Why, who knows, keyboard programmability into the commercial segment as well. Maybe, or maybe Motorola didn't wan't their own radios coming back to compete with their commercial endeavors, the real reason for type acceptance nowadays.

(snipping inane bullshit for brevity:)

>Let me ask you a serious question. Why do you listen to these clowns?

Honestly? Because it's good, cheap entertainment. Beats any of the politically-correct, morally-bankrupt garbage on network television these days. I don't condone this kind of behavior and I don't participate in it, but I have to admit, it IS rather humorous to listen to these guys who's sole purpose in life seems to be jamming and making amateur radio life miserable for each other.

>Why must you, 1. Listen to this trash

Because I enjoy doing so.

>and 2, tell the world about it in the newsgroups.

Because I enjoy doing so. If you don't want to read my posts, use a killfile or go elsewhere. I know some of the...uh, "more distinguished" hams dislike the fact that I am letting the rest of the world in on their "dirty little secret" that has been 75 meters for several years. Tough. I'm having a good time doing this, about 80% of my e-mailers are getting a good laugh out of this, and I intend to keep doing it in the spirit of which it's intended: good humor. Lighten up...it's only a hobby, after all.

>Also, do you think we really give a shit what your cb call is?

Why is it considered acceptable, even encouraged, to post ham callsigns, but yet CB callsigns are not welcome? The majority of ham operators began as CBers. Many, like myself, still enjoy CB radio. I am active on both ham and CB; you will find a 2m/440 antenna on my car as well as a Wilson 1000. What is it about this that makes it such a capital offense in the eyes of the...uh, "distinguished" hams? Moreover, the CB callsign reflects an earlier time when licenses were actually REQUIRED on CB radio and FCC enforcement was a way of life. You didn't have all the garbage on the band that you have now, and serious communication was actually

possible and accomplished. Just because I now hold an amateur radio license does not mean I'm going to get rid of all my CB equipment and renounce having ever operated there. I enjoy both and make no apologies for this. Why should I? Again, it's just a hobby. Lighten up!

>Exercise your right to use the two most important controls of your radio,
>the vfo and the on/off switch.

I most certainly do when confronted with that which I do not wish to listen to. And I would suggest you employ the same technique with killfiles and your newsreader when encountering that which you do not wish to read.

>chart shows:

How can they be CBers if they're not operating on CB frequencies? As I mentioned in an earlier post, since they're mostly using modified amateur gear to accomplish their means, they're really illegal or bootleg ham operators.

>26960 - 27410: Citizens band
>27410 - 27540: Land mobile
>27540 - 28000: Government

>so if they had any intelligence they'd remain well below 27540.

What the allocation chart says and what the frequencies are used for are two different things. When was the last time you heard Government comms between 27540-28000? I don't think the freebanders would be using 27.555 as their main calling channel if the government was active there, do you?

>The major problem for us is that they spill out onto 10m.

A few do, and they should be dealt with accordingly. But the majority do not. They enjoy freebanding because it's "free" of what they perceive as the formalness and "stuffyness" of amateur radio. They have no interest or desire to converse with ham operators on 10 meters.

>They also "freeband" elsewhere on HF; years ago there was talk

In article <01bc1d01$0de7d040$a3d879a8@soho>, bryant@sohobusiness.com says...
>
>I have a 96 Blazer with severe noise. Mine causes problems an AM when
>listening to DX. Switched radio, antenna, power leads and antenna lead
>with no help. Is the fuel pump considered the primary offender in these gm
>cars and has anyone talked to GM about it?
>
>Mark

Mark, I think it is considered a primary offender by lots of HF hams and CB'ers. I have talked with numerous hams who have stated that it is a particular offender when the antenna is mounted at the rear of the vehicle and a non-FM mode is used on HF (ie SSB). I have a friend who buys a new Suburban every year, he also uses a CB radio and always experiences RFI from the fuel pump. His wife's new Blazer does the same.

A Cadillac dealership parts man said that Cadillac solved the problem in the late 80's or early 90's by installing a new design pump (retrofit in some cases).

The people associated with GM (that I talked to) indicate that the interference is of little concern to them. They don't install communications radios in their vehicles. It doen't much affect AM radio (stations are usually very strong an there are lots of other interference sources and FM somewhat rejects the noise, although it can reduce the sensitivity of an FM radio). GM police cars are specially prepared by a fleet group. A person in this organization mentioned the RFI filter/harness for the Lumina (GM# 25027405) that no one that I talked to seemed to be aware of (at GM, Delco, or dealerships).

The symptom is a raspy whine in the radio almost independent of engine speed. An alternator can produce such a whine, but the pitch will vary with speed. On most fuel injected cars the pump will run for a second or so after the ignition is turned on, but before the engine is started. If you hear the whine then, it probably is the fuel pump.

You can make a "RF sniffer" from a piece of coax with a connector at one end and a short loop connected between the center conductor and the shield at the other end . Disconnect the antenna and connect this coax to your radio, move the loop around the car to locate the source, pump noise will be strong around the gas tank.

Yes, amateurs can make their own radio without type acceptance, but they cannot manufacture, in quantity, radios for sale or lease. I have heard a lot of people correcting my seemingly wrong statement. I would simply direct them to both Part 2.800 of the FCC rules and to the back of their very own commercially manufactured radios, and on the back, you will find an FCC ID number (the type acceptance). Type acceptance for Part 97 operations only, and on the back of their Motowhiz, another FCC ID for Part 90 operations.

As a licensed amateur, and one who can read and understand the english language, I would direct you to Part 2.800 and specifically to Part 2.1005 of the FCC rules, and if that doesn't work, take a look at the back of your kensucom radio, see that little FCC ID, know what that is, thats right, it is the type acceptance ID for that amateur radio. If you would like to read parts 2.981, 983, 991, 993, 997, 999, 1001, and 1003, you will see just how much trouble Icsuwood had to go through to be able to sell you that radio frequency device, and if you want to build one for your own use, Part 97 allows that, just don't build them for resale without going through the same trouble. Like anyone with such a poor understanding of "ALL THE RULES" could ever build anything!

> If you want to join, you must tender your social dues. It is a very
> simple concept.

I appreciate Miller's romantic notion of using CW as a means of paying one's dues. However, would Miller be kind enough to explain to us under what circumstances is the government entitled to stipulate a certification structue designed to ensure that an individual must pay ones dues? Furthermore, given that CW is an important rite of passage into ham radio, then why is the individual allowed to operate above 30 MHz without having to demonstrate competence in Morse code? Is the government justified in certifying individuals in the Morse code as social filter much like a fraternity or sorority hazing? Is it the role of government to be an agent of fraternity or sorority hazing? What goal does Miller expect with using Morse code as a social filter? Or, more to the point, is Morse code a social filter, as Miller presumes?

Presuming I wish to be a member of a fraternity, I can pick and choose the fraternity of interest. If I were to find that a particular fraternity's hazing rituals to be distasterful, there are many others which have intitiation rites which may not be so objectionable. But it seems to me that Miller wishes to maintain a testing requirement merely on the notion that it is good for me to be subjected to fraternal hazing. I disagree. Perhaps Miller would be kind enough to indicate what my options are should I decided not to be subjected to such hazing, that is to say, what are my alternatives to being subjected to government hazing?

> The international dictates requiring CW proficiency may
> have outlived their justification, but will the intrinsic amateur radio
> operator population let go of the attachment?

More to the point, under what circumstances is the government justified to demand demonstration of a skill that has outlived its justification?

By the way, Miller's use of intrinsic seems to be incorrect. I suspect he means that Morse code is intrinsic to the amateur radio population. I would tend to disagree with him on that point, except to say that it is intrinsic to all those who wish to be granted the authority to operate below 30 MHz. After that, due to the optional use of this mode after certification, its intrintic quality is lost.

> Those who want in without
> benefit of hazing cite numerous technical issues as to the obsolescence
> of the mode and those who insist on the hazing cite numerous operational
> issues as well as some technical issues as to the need to keep the CW
> requirement.

In contradiction to Miller, I must say that the majority of those who advocate the abolition of Morse code testing have already been subjected to such hazing. Yet, I agree with his opinion that many of those who wish to retain Morse code testing indeed cite operational concerns and issues. The problem with these concerns and issues is that they don't hold much water even after a cursory examination. Does Miller believe that Morse code testing should be retained even if the operational concerns and issues as expressed are not indicative of the current operational environment of amateur radio?

> These arguments for and against the CW requirement tend to
> nullify the issue and miss the whole point. Is CW necessary to the well
> being of ham radio?

If it is, then how is the government justified in demanding competence in this skill when obtaining this skill is irrelevant to its legitimate concerns of management of the radio frequency spectrum? Since Morse code testing is irrelevant to this issue, why not let use of Morse code be predicated to needs and desires of the amateur community, rather than by dint of government regulation?

> Since the very existence of amateur radio can be traced to romantic
> adventure and a machismo attitude among its members and members to be,
> CW could be regarded as the most rigorous venue among radio transmission
> modes.

I disagree with Miller that amateur radio can be traced to romantic adventure and machismo. The fact that the early amateur radio pioneers have been canonized as such is one thing, but it would be more believable that they wanted to learn to use this natural resource, rather than as means to show the world that by use of this phenomenum of radio, I doubt that Morse code knowledge would have been much of a factor in attracting feminine company.

Would Miller be kind enough to show the link between the adventure and machismo attitude of its members and CW could be regarded as the most rigourous venue among radio transmissions modes?

Be that as it may, what does "CW could be regarded as the most rigorous venue among radio transmission modes"? It meaning can be taken so many ways that the statement is seemingly valueless. For example, does Miller mean that CW is rigourous because the knowledge of which is tested prior to being granted

on the amateur bands below 30 MHz? Or that it is an internationally accepted encodification of an OOK signal. Or, that it gets through when no other mode will? For that matter, if Morse code is so rigourous, then why has it been abondoned by every other user of the radio frequency spectrum.

I would appreciate it Miller could be more explicit in his meaning.

> The biggest signal on the air and the best receiver that money
> can buy coupled with the highest antenna that can be erected will not
> mean a thing if the ham cannot decode the tiny signal from a 15 watt
> transmitter in Senegal. That is reality.

So what? That is applicable to any emission. However, I believe that Miller is trying to make the point that "Morse code gets through when no other modes will." That, however, is not reality, but a myth.

> You can argue that a good
> computer program and a nifty DSP filter could accomplish the task and
> win the debate. But the victory is a technical one and misses the
> entire point.

Indeed, it is Miller who misses the point. The debate is not which mode is the better mode, mostly because those who oftentimes make such comparisons, are either ignorant of the relative merits, or refuse to acknowledge them. Thank heavens we have individuals like Coffman posting in the newsgroups with their cogent viewpoints. Even so, most of the discussions on which are the better modes resolve themselves into shouting matches, reflecting an individual's preferences. But even it that is true, would Miller explain under what circumstances should an individual demonstrate Morse code competency prior to being granted access to the amateur allocations below 30 MHz when the sole criteria is that based on another individual's preferences?

> Why not have the same pan intelligent process answer the
> ham in Senegal as well and take your participation out of the equation
> altogether?

Why not indeed? When I was in Senegal, I asked one of the members of the Senegalese national radio society if their members speak English. He state that they know "radio English", that is to say, they can recognize certain phrases for the exchange of information such as RST, QTH and station apparatus. Beyond that, one whould have to speak French to them. Considering that the average US citizen does not speak French, most contacts to Senegal will be limited to these short exchanges. Having a pan-itelligent process would likely go a long way to appreciating an individual who does not share the same linguistic capabilities (save the notional autotranslators on Star Trek - but I suspect that they are a few years away from becoming fact). So, does Miller believe that Morse code communications is a precursor to a futuristic autotranslator?

> And this is my small point in favor of CW. CW is nothing more than a
> small payment up front for an enormous payoff in future rewards.

... and what rewards are these, pray tell?

> It has
> become the only mystery left in the grand amateur radio schema.. Why
> fight it? Savor it.

Being a Roman Catholic, I have to accept certain dogma and teachings of that organization, even though they are explained as mysteries with no other explanation of their existence (i.e. the Assumption of the Blessed Virgin Mary into heaven, rather than her having to suffer the pain of death.) However, although Miller believes Morse code is a mystery, it is only for those who have not bothered to learn it. Quite simply, hear "didah", write the letter "A". Since Morse code is not a mystery, in contradiction to Miller's view, why not fight it?

I accept your words without question. However I repeat my previous
allegation that radio amateurs are *not* required to use any type
accepted radios, and specfically I continue to insist that the
Motorola sets deigned for other services are perfectly legal for use
in the amateur service, contrary to what had been stated previously
in this thread.

The 1997 National Amateur Golf Tournament is quickly nearing with only 6 weeks of registration left before play begins in mid-April all across America.

If you are a golfing enthusiast who enjoys playing competitively this may be the tournament opportunity you've been waiting for.

With the national pot expected to be well over $125,000 this year, this could very well be the chance you've been looking for to prove your golfing prowess.

For further details regarding the tournament and registration with The Silicon Hills Golfing Association please e-mail <Zider@msn.com> for all details pertinent to the tournament (registration, play, and prizes).

We look forward to hearing from you and finalizing the memberships for this year's National Amateur Golf Tournament!

The Silicon Hills Golfing Association

I have a TS-830S which displays the same thing... play in the VFO. I have asked the same question in the past and received the same answers as you have received from Dan Nelson..... I was told that it does not affect performance and I tend to agree as I haven't detected any problem.

Glad that I wasn't the only one wondering <grin>.

I have enjoyed shopping and listening to various stores and fast food joints. Boy what goes on! Sincere service is NOT like it used to be... But does anyone have the frequencies for Sam's Club employees? Would have been nice when they had a blackout and herded us to the front like untrusted cattle. How did they handle security before the vid-cam?

maybe someone could take a freq counter to one and let me know!

>understanding of "ALL THE RULES" could ever build anything!

Are you perhaps confusing the different levels of Part 15 certification
with 'type acceptance"? "Type acceptance" is something very specific,
and only applied to external power amplifiers below 144MHz in the
amateur service. However, receivers are subject to some level of
Part 15 standards, and, in some cases, receivers must be formally
certified, and in others, not.

But, you knew all this and just wanted to flame anyway, right?

From: algol@globalnet.co.uk
Message-ID: <5esovo$s7r@kew.globalnet.co.uk>
Source record: 203827

At present my antenna consists of around 50 feet of quite thin copper wire, salvaged from an old transformer. This longwire is folded around (due to constraints of space) but seems to perform fairly well with my Yaesu FRG-880.
I was wondering if anyone out there could tell me whether there is any advantage to be gained by using the very much thicker stranded copper wire which is usually supplied with antenna kits. Also, will the fact that it is bent aroud over its length affect it's performance over one which is in a straight line..
Any comments would be much appreciated.

Many thanks.

John.

Concerning the Member Comments Sought On Licensing Structure story in the March 1997 issue of QST.

I have re-read the story several times in order to try to understand what the ARRL planning Committee was generally proposing to the Board. As I understand it, we may be looking at a major, if not complete revamping of the Amateur Radio licensing structure. I would like to offer my comments concerning this.

I am 45 years old and have been licensed almost 33 years. I began as a Novice, upgraded to Technician, General, and finally in 1969, Advanced. I have been a member of the ARRL for a total of 17 years, and have been active in all phases of Amateur Radio other than packet and digital communications. This activity includes homebrewing equipment and antennas, microwave communications, moon bounce, both HF and VHF contesting, public service communications, repeater administration, teaching licensing classes, DX, and many other activities encompassed by Amateur Radio. Professionally, I am a market researcher and analyst.

Perhaps the most important concern gleaned from the story was the Committee's identification of the development of two separate amateur radio communities, one being active on VHF and the other active on HF It seems to be the Committees general opinion that this is not a good thing. In my experience this is nothing new to Amateur Radio, although it seems to be accelerating, and in my opinion it has always been damaging to the service. It should also be recognized that there are separate sub communities that have developed on both the VHF and the HF bands. The Committee is correct in pointing out that the present licensing structure may be some of the reason for the deepening segregation among various amateur licensees.

The no code Technician license has worked to bring large numbers of people into amateur radio who otherwise would not be in the service. I believe that this license is the most popular way in at this point. However, it has also worked to set up the present situation that the Committee is addressing. There seems to be a decreasing amount of movement from the Novice, Technician, and Technician Plus licensees to the General and above classes. This is what seems to be causing the perceived split of the amateur community.

From a market researcher's point of view, several questions need to be asked concerning the long term effects this trend.

1. What is the average age of the group identified as the VHF community as opposed to the average age of the HF community?

2. Can we expect some measure of de-population of the HF community in future years because the VHF community can not be homogenized into it?

3. What then are the long term prospect for our HF bands if the present users die off faster than they can be replaced?

4. At what occupancy level do our HF bands become targets for re-allocation to other services?

5. What are the present rates of demographic change?

6. Why is there not more migration from the VHF community to the HF community?

There also may be some economic impact here. I noticed in the same issue of QST where the League had an operational loss of $700,000 for its last fiscal year. The reason cited was a fall off in advertising due to slumping sales, even in what has been described as a booming economy. This leads to still more questions.

1. Which community, VHF or HF, tends to spend the most per capita on new equipment each year?

2. How does this spending breakdown to license class?

3. Are age factors involved here?

4. What is the ratio of ARRL membership among all the various license classes? Is the League over penetrated in some groups and under penetrated in others? And to what extent?

It is my opinion, based on observation, that the present financial problems with the ARRL, the downturn in sales among advertisers, and the splitting of Amateur Radio into two separate communities are all symptoms of the same problem.

What is the problem?

The Amateur Radio licensing system has to one extent or another always been based on the idea of incentives. Although I was young, I remember the huge uproar in the 60s when this system was widened to the point of actually taking operating privileges away from active amateurs who had already earned them. I remember not being allowed to join some radio clubs because I did not have the proper license. I remember when you had to have a specific license class or higher to be elected to leadership posts in some clubs and, I believe this is correct, in the ARRL itself.

The most poignant memory from my early years of Amateur Radio is that of older, more experienced holders of licenses above the Novice / Technician level getting on VHF and calling CQ - CQ - CQ... class A operators only.... no lids.... no kids.... no space cadets. This kind of overt segregation does not exist to any great extent today, but there seems to be a more insidious segregation going on within the Amateur Radio community.

I refer to the letters that are printed in QST and other magazines concerning the inability of newly licensed no code Technicians to make

contacts on repeaters because they are ignored. I have heard this class of licensee referred to as the "ghetto" of amateur radio. I have heard of repeater administrators switching PL codes to try to lock out newcomers. More repeaters seem to be closed. It is my opinion that this treatment of the no code technician probably stems from the belief that some amateurs have that the no code Technician license represents a lowering of the standards of entry into Amateur Radio. The code - no code debate also seems to inflame this kind of treatment. There is a cardinal rule in direct marketing which states "Birds of a feather flock together". I think this is what is happening to Amateur Radio.

Can the Amateur Radio Licensing structure be modified to combat and reduce the problems the Committee outlined? It is my opinion that to a certain extent, yes it could. It is also my opinion that each class of license carry with it operating privileges that allows the licensee a Full Taste Of Amateur Radio. This means VHF and HF operating privileges and all primary operating modes common to the spectrum allotments they would receive. By a Full Taste, I mean full VHF privileges and allotments on at least 3 - 4 HF bands that include SSB, CW, and other digital modes on every band allotted. (30 meters being exempt because of the phone restriction on that band)

The limiting factor with this approach is the international treaty concerning the code proficiency requirement for operation in the HF range. Is there any way around this without having the amateur fraternity tear itself apart with another code, no code debate?
I do not know what level that proficiency has to be but perhaps just a general knowledge of the code, at 1 or 2 wpm would be enough to satisfy this requirement. Maybe an open book code test would suffice. Remember that the Committee is proposing an open book test for the Novice licensee that would have to be taken in order for them to keep their license, So the concept of open book testing has already been established. I propose that we extend it in order to satisfy an international treaty which is the present limiting factor for HF operation in this country.

Any restructuring of the licensing system should also insure that no one loses any operating privileges that they have already earned without replacing them with comparable privileges. However, once again, I notice in the Committee report that there is a movement to take away operating privileges from those who have earned them. Specifically, the Novice licensee. I understand that Novices are an easy target because they are small in number and have limited input into ARRL affairs. I know that the Committee has some data to show that only 50% of the presently licensed Novices are active but I wonder about the percentage of activity of any license class. In addition it is proposed that a Novice would have to take another test to gain additional privileges. No other class of licensee would have this requirement.

It is interesting to note that the no code Technician licensee loses no privileges although a good case can be made that the Novice licensee has probably done more to earn their license by virtue of the code

requirement. I also notice that the Committee is propagating the idea that the code is too difficult for many people and the testing is sometimes not consistent. Learning the code may be a limiting factor for many people but the decision has already been made concerning the no code license and some way must be found to deal with it if the concept of a more equitable licensing structure conveying privileges in the HF region is going to be viable.

There is no doubt that the present Amateur Radio licensing structure is complex and tends to segregate people. Many like it that way and would not propose any changes. It is my opinion that what is happening now is damaging to the service in the long term for many of the same reasons that the Committee reported.

Here are my thoughts and suggestions, and the reasons why.

1. In an ideal situation, Amateur Radio should have just one class of license that conveys all amateur privileges. However, I suspect that the price of entry in terms of licensing requirements would be so high that we would be in a no growth or deflationary situation rather quickly. I have heard this proposed but to make it work, every presently licensed amateur would have to be upgraded to this license. If we could get around the HF code requirement it may not be such a bad thing to do this.

2. We could take a page from the skilled trade unions and offer, for lack of better names, Apprentice, Journeyman, and Master class Amateur Radio Licenses.

A. The Apprentice license would be the entry level license and offer the Full Taste Of Amateur Radio as described above. A way to assimilate the no code Technician licensee into this class is described below.

B. The Journeyman could be the equivalent of the General class license but with a 10 wpm code test with almost full amateur privileges.

C. The Master replaces the Advanced / Extra class license and would carry full amateur privileges after a more comprehensive theory test, perhaps a 13 - 15 wpm code test (remember the learning hump at 10 wpm which the Committee pointed out) and can only be earned after a minimum set time of being licensed as a Journeyman. Perhaps 3 to 5 years. This is the license for those who feel that there still has to be a license which conveys some exclusiveness that comes with experience and accomplishment.

In no case do I feel that more than three classes of license need to be offered.

In this scenario, all present Novice and Tech Plus licensees would be upgraded to Apprentice and receive full VHF and some HF privileges as described elsewhaer in this post. The no code Technician license would not be offered upon adoption of the new licensing structure. unless a way can be found around the treaty mandating the code requirement for HF operation, no code Technicians would have until the end of their present license expiration to demonstrate some code proficiency and upgrade to apprentice. Until that time, they lose no earned privileges.

All General class licensees would receive the Journeyman's license and also receive increased operating privileges by virtue of merging the present Advanced class privileges into the Journeyman's allocation.

All present Advanced and Extra class licensees would be granted Master class status with full amateur privileges and possibly a preferred call sign if it is desirable.

The Extra Class licensee loses no privileges, but does lose a little exclusivity.

I think that this proposal levels the playing field for all amateurs and will go a long way towards ending the segregation of the service. As stated in the Committees report, any restructuring of the present licensing system will be controversial. However I feel that if licenses granting VHF only privileges continue to be issued, the main concern of the Committee, that of separate amateur communities, will not be solved.

A note concerning the ARRL.

I have noticed that a good amount of the posts to this newsgroup tend to bash the ARRL. For better or worse, the ARRL is the premier organization representing Amateur Radio at the national level and is the organization that is looked to by the FCC for an organized body of comment when changes to the Amateur Radio service are proposed. Like it or not, the FCC has decided, at least for the time being, the Amateur Radio service should be somewhat self regulated and self policing. At present, the ARRL is the only cohesive organization we have to effect positive change in the Amateur Radio community. For some years, I was not a member of the ARRL due to the incentive licensing proposals of the 1960s. I still personally think that these proposals were ill advised at the time, but I have come to understand that as a community, we need the ARRL. Your voice is stronger with them than without them. There are apparently big changes coming in the Amateur Radio service. It is vital that the ARRL receive your input.

I am very new to amateur radio. In fact I have yet to get one piece of equipment. But I have several questions about this hobby and hopfully someone out there can help show me the way.
Firstly, this whole code/nocode debate. How many letters are in a word? I am quessing that it would be about 5, I assume that there must be some standard word length on the tests. At 5 letters per word 5 wpm does not seem like too much to learn (a bit over one letter every 2 sec) But something like 13 or 15wpm seems like it would be a little too fast for most people.
Second this no code tech class, what can you do with somthing like that? What bands are you allowed to broadcast in (what is typical range and use of those bands)?
At the current regulations what would someone gain by getting an advanced liscense opposed to just a novice class. I guess what I'm asking is what is out there to make it worth taking the extra tests?
Third, I assume that these tests are just for people who want to broadcast but do you need anything other than equipment to listen only? What are good things to listen to? I have read in Pop'Comm lists of foreign radio stations, pirate radio stations and other lists that I don't quite understand. When frequencies are listed are they in hertzs, khz or mhz. They are normally just 4 to 6 digit whole numbers. What do you need to listen to all of this? What is below 500 khz that would make more expensive equipment worth it?
Fourth, how othen do you need a TNC or MPC? Is it just for sending and recieving packet? Or can you/do you intercept other people's packets like military/gov? And what use is this information since I would assume that most of it would be encrypted?
To me the hobby seems like it would be rather fun, its just so confusing to get started. To be able to listen to radio from across the world would seem to be very educational. To tune in on the police and government among others would be fun. But is it worth the incredible cost? It would seem from what I have seen so far that you can't really do much for under $1000. A good TNC with lots of feature and formats like the Universal 8000 is like $1300. You need a big antenna on a big tower which would cost several hundred dollars. A transiever unit that has mutiple bands is about $1000. I have read that you can pick up used 2 meter units for around 100-150 bucks but what can do with one of those?
I seems to me that the problem that amateur radio has with getting new people involved is not really code (yes the higher wpm rate might weed out some but 5wpm seems like almost anyone could pass) but infact its the cost and confusion of what you need to get to have any fun in the hobby that is throwing people for a loop.

You can brew it and use it, but you can't sell it in quantity without type acceptance. The rules have not changed. Many manufacturers go ahead and advertize new equipment with the footnote "pending FCC type acceptance." Haven't you seen this in QST and CQ? Commercial equipment is type accepted for use in all services and does not require additional FCC blessing for ham use. Part of the type acceptance requirement for H.F. amplifiers is they cannot operate above 15 meters. Another one limits the maximum plate dissipation in the final tube(s) of amateur amps. Another one that comes to mind is that wire you have to cut to make your new transceiver transmit out of ham bands....

>I use an all band dipole made with 12 gauge insulated wire and fed with
>heavy gauge 450 ohm ladder line.

A question about this setup - what happens when the dipole is way too short, like on the order of 1/4 wavelength or so? I'm getting my Plus in a few weeks and I have to install an indoor antenna since I live in a condo. My rig is on the second floor, so getting a good ground (and thus an effective unbalanced antenna) is problematic. I have about 30 feet clear in the attic. It seems like putting in a non-resonant dipole and using it with 450-ohm line and a transmatch might be a good solution. I could install a resonant 10 or 15m dipole but those bands are pretty dead right now, and I'd like to be able to use all the novice bands. I can probably get a short dipole to load up on 40 or even 80 but from the books I've read (3 generations of ARRL antenna handbooks) I haven't been able to get an idea of whether or not a "random length dipole" will radiate well on long wavelengths. Will I just dissipate all my power in the transmatch and feedline? Will my house iwring end up doing all the radiating?

Thanks in advance,
-Wiley KF6IIU

Notes
=====

The distances were calculated using the International Ellipsoid of 1924 (polar radius 6356.912 km, equatorial radius 6378.388 km). Details of the calculation method are available on request.

Propagation modes are those reported by the stations concerned. However, it can sometimes be very difficult to distinguish between propagation modes. This is especially so on 50 MHz, where mixed-mode QSOs are common, and to a lesser extent it applies on 144 MHz. The propagation information should be read with this in mind.

Station positions were taken from the best available information, in the following order of preference:

1. Exact latitude and longitude where known
2. Locator sub-square center if given
3. Approximate latitude and longitude from geographical location.
4. Distance as claimed by the QSO participants.

Calculated distances may change if better information on station location becomes available.

If you have any information on a possible record or exceptionally long distance QSO please send it to the IARU Region 1 VHF/UHF/Microwave DX record co-ordinator:

John Morris, GM4ANB,
35 Main Street, Hillend, By Dunfermline, Fife, KY11 5ND, UK.

Or via packet: GM4ANB@GB7EDN.#77.GBR.EU
Or via e-mail: john@kirsta.demon.co.uk

An on-line copy of the latest version of the table is at:

I would like to thank Tim Cook for helping me out. I really didn't
expect to get an answer back so soon.
Again thanks Tim.

4443. 3894.5 vs. 3853

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-24 00:00:00 UTC
From: Bubba N5RWC <Tim_Raffety@Oxy.com>
Message-ID: <3311D22E.107B@Oxy.com>
Source record: 203848

For years now I have been tuning into the "going ons" of 3853 and lately with all the talk about 3894.5, I decided to yune in on them to see who had the best "thing" going and by far 3853 wins hands down.

Friday and Saturday. A person they call "The Ham from Hell" who was IDed as James, N5RWC was spouting four letter words wholesale. Then, there was this anonymous heckler in the back ground prodding James by repeating "I wanna hear what James has to say" and that would fire James up because everyone ignors him on there.

Then we had a special guest appearance from 3853's favorite World War II bomber pilot, Lying Dick KD5BZ. This night Lying Dick seemed to have been kicking back on grandpas cough medicine a little and was on there trying to have a heated debate about Harry S. Truman until someone said something he didn't like about old Harry and he went ballistic!!

These two nights we had no less than 15 people on the freq going at it in every which way.

Now, there is nothing wrong with the regulars on this freq. They are all a bunch of good ole boys and they never bother anyone but these guys are the target of various hecklers that move up and down the 80 meter band and causing trouble and departing leaving everyone pointing fingers at each other. The same happens on 3894.5. I hear the same sound of a person laughing with an echo over and over. Then I hear the sound of a "dive dive dive" siren from a sub or the starship enterprise red alert.

Anyway, I found this to be much more entertaining than 3894.5 was these two night and on most nights. If you listen, you might hear the playing of a rap song called "James R. Vinning is a drunken queer". That's the ham from hell guy N5RLX. I didn't know there was so much talent on there! I am serious! Sunday night they were talking bible talk and quoting scriptures! Something your sure to never find anywhere else on the band. Tune in and you'll soon be a believer like me!

See you there!

Actually, those are type certification numbers, on the reciever.

They are NOT type acceptance numbers.

No, I'm not. I'm just trying to piss him off. Burt does these things to
get a raction out of people. It is inorder to make up for his own lack of
self worth. I'm going to get a reaction out of him.

So, you are pro little leo's ehh.

One of the reasons there is such LITTLE use of 2 meter bandspace is because of closed repeaters. This point really hit home with me. Little Leo addvocates claimed that the 2 meter band is under utilized. After touring Atlanta GA to Columbus OH, scanning like crazy, it is hard to disagree. In Ohio we are lucky to have 2 or 3 LARGE linked repeater systems, but I would still put bandspace utilization at an overly optimistic 1/3.

Something to think about

My wife can piss me off because I respect her, my daughter can piss me off because I respect her, my students can piss me off because I respect them but a ham is incapable of pissing me off, can you guess why?

I play with hams like a shark plays with its prey.

4457. Manual for Sprague Telohmike TO-4

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-24 00:00:00 UTC
From: hmiller@fix.net
Message-ID: <3311ec7e.2564437@news.fix.net>
Source record: 203862

Hello, This is Harry Miller KB6CGG. I was looking through my files
and found the original manual for a Sprague Tel-Ohmike TO-4. I
would sell it for $5 mailed. If interested, email me
hmiller@fix.net

73 de Harry KB6CGG

4458. TRADE! MFJ-2270 for AUTOPATCH UNIT.

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-24 00:00:00 UTC
From: dbryndal@ashland.edu
Message-ID: <5etkib$gfi@sol.ashland.edu>
Source record: 203863

I am looking to trade a lick new in box MFJ-2270 packet controller for a DTMF controlled autopatch. I will consider some monitary compensation for new and more advanced features. IE: CW identifier, speeddial, voice delay, duplex, timeout. I dont need a repeater controller just an autopatch. The Packet modem is not sate of the art but is in new condition with MFJ's EXTENSIVE manual for the beginner in packet. Opperates up to 9600baud on 144 and 300-2400 on HF. 32k ram for mailbox use. I have no use for it here in South Carolina. Two DIN to bare cables included in NEW condition.
Nice beginneror auxilariy unit.
I would appreciate a response. Dave Bryndal
dbryndal@ickis.gilmour.pvt.k12.oh
ALSO anyone know where I can get a FT-51 repaired? The RF baord is shot and the BNC jack needs replaced. The left poor thing on the roof of my car and forgot it and it flew off. IT STILL WORKS! kinda...

You are technically correct, but ethically wrong wet. If you set up
to provide a public service as a BBS, you have a moral obligation to
forward all legal mail, or at least not to limit forwarding based on
personal considerations such as who is saying what. SysOps who censor
mail are a big problem on the ham BBS network, and responsible SysOps
should and will route around them.

If you're not part of an open network, you're just cluttering up
valuable space on the bands, and are giving jerks like Burt more
ammunition.

Hello Bill: Oh I am sure being lazy is part of it. But a majority of the people are turned off by the ham radio snotty attitude. Why is it that we CB'ers arn't welcomed and assisted into the ham radio fraturnity with open arms. Maybe just human nature here. But I really think ham radio has lost it's appeal to the majority of people. I for one have been studing the morse code, one and off for more than 25 years. And still haven't passed the 5 wpm morse code test. I get a real charge out of copying a few words and numbers.

You are confusing being a radio operator to a bunch of people who want to have a good time.

A lot of common people want a radio service that they can talk with one another without all the stuffy stuff. The locals here go bowling and have a few beers, and whisle at pretty girls. Never seen any hams do this.

A few weeks ago the local freeway was shut down for early morning traffic, by the police. The local CB channel had the hot scoop, on the traffic jam. The local 2 meter repeater had a extra class ham complaining about closed repeaters. If I owned a repeater it would be closed also, for these guys. The local CB channel is quite active in the early morning hours. Example of what is herd ..... "This is RJ saying good morning to everone one channel 12 this morning" .... "Yeah good morning RJ this is Silver Lineing, waving back to ya, goog morning" .... I don't mind the ecco mic and roger beep from this guys. I come on the channel and say "Good morning channel 12, this is Jay, Hill Climber is the handle" and about 4 to 5 stations say Good morning back. I like the

friendly and informal attitudes and ways. I turn off the 2 meter rig.
And plan on buying a bowling ball. Ten-4.

Jay at jay123a@ptw.com

> from, for lack of a better description, the traditionalists of Amateur Radio.

Sure, there will be a lot of screaming from those that feel sweat is
where it's at. ;-)

> It may be wise to include a two or three year non renewable license that allows
> entry and my concept of a FULL TASTE of Amateur Radio. I would be interested
> in your thoughts concerning the single license concept. Would you have CW
> requirements?

I think that is a separate issue. Personally I see no valid reason to
maintain it for the numerous reasons stated in this newsgroup. I
suspect
the same people that support Morse Code testing will be adamantly
against
a single class license as it represents such a dramatic change and they
seem to be more interested in maintaining the status quo.

> At what level would the theory testing be?

Probably between general and advanced. If you believe as I do that the
primary purpose of licensing is to ensure the safety and welfare of
others, then you are either capable of operating an amateur radio
transmitter safely and correctly, or you're not. The material for
the advanced and extra exams don't really address those concerns.
They seem to be more a focus on trivia. I always thought it was
funny that the advanced (at least I think that's the pool) contains
a number of questions on weak signal VHF+ propagation. Something
that would seem to be more appropriate to the technician class
than the advanced class based upon privileges granted. That in
part is why I'm so opposed to the current licensing structure. If
an "incentive" licensing scheme is an absolute must (which I don't
believe it is), then at least make the required knowledge and
skills related to the privileges awarded. Currently they are pretty
skewed.

> How would you assimilate all existing licensees into this class?

If there is only one class of license, all licensees become that class.

> Sometimes the first thoughts on a problem turn out to be the best thoughts.
> I would hope that the ARRL once having identified the present problems
> with the licensing structure would be open to any and all proposals as
> to how to fix these problems.

I don't think the believe there is a problem. The current licensing
structure by and large is a result of ARRL lobbying. They may not have
gotten things exactly the way they wanted them, but they certainly
pushed for this rather baroque scheme we currently have. Just another
reason I chose to no longer allow them to claim me as a member.

As I've said before, I would think more about upgrading if I had facilities
to operate where I'd actually get some enjoyment out of hf operating, 75
and 40 meters, where I could help out nts and ragchew with some friends.
Chasing wallpaper holds zero interest for me.

>BTW, I agree that the current sub-bands encourage spectrum waste.

>year, we desperately need high speed digital communications on our
>microwave bands.
>If ham radio offered a good compliment of analog and digital
>technologies we'd have no trouble attracting plenty of new people.

I enjoyed your op-ed in QSt, btw, and agree. I've seen folks talking about
our 9600 baud backbone here in Iowa like it's the greatest thing since
sliced bread, but, when it fails, we're still forwarding traffic between
pbbs stations on 145.01 at 1200 baud.
We must encourage young folks to become hams and take an interest, or the
commercial interests will grab up our microwave spectrum, and who wants to
exchange signal reports and wait for a qsl card from wherever that's rare
when we can carry on a meaningful conversation with them over the net?
This is the attitude I hear from many young folks who are computer

literate. They see ham radio as irrelevant.
Little do they realize that their cellular phone is not a viable alternative for networking during a disaster.
For coordinating a group of people, nothing replaces good ol' two way radio technology. With the cell tel you can contact one other place at a time.
This means ham radio when the regular communications infrastructure is overloaded or broken down.
For ham radio to step in and fill this role, we need active trained communicators. Good high speed microwave data links would be a boon to emergency communications, as well as show recruits something they could grab ahold of.
With such links, I can see a lot of nts traffic moving to packet radio. TO achieve this, though, we must have forward-looking people who aren't stuck in the stone age of radio.

I would hate to see us lose the amateur service as we know it, and we can stave this off by such things as high speed microwave data links. With this, and other good points to use to sell ham radio to our youth, we can keep our hf spectrum vibrant and active, too, as there will always be folks who enjoy those modes.
There's something about stringing a wire between two trees and getting on with 50 watts or less and working the world. There's plenty of room for both schools of thought in the hobby, but to keep it, we must convince both our government and our youth that the hobby is relevant.
Part of this is technical excellence, but a bigger part is a real outreach effort.

I try never to miss an opportunity to show the uninformed my hobby. Even if they don't take an active interest, they at least know we're out there, and still serving our community. I can point to all sorts of operating interests and show the uninitiated how those operating pursuits can be a tool for training which is put to good use during times of emergency.

I've wandered a bit off the beaten path of this thread, but I get on my soap box now and then when discussing the future of a hobby I've enjoyed from the outside since I was a kid, and recently became part of. If we don't keep up with advances in technology, we're no longer going to be able to fill our traditional roles as communicators, and that will indeed be a sad day for the service.

Drew, the propagation on 75 is very different than that on VHF. If some-
one so much as sneezes on HF half the world can possibly hear them. What
occures on 75 is no "dirty little secret." Anyone in NA can tune in.
Ask yourself why HF repeaters don't exist (aside from the illegality
issue). You're essentially acting like a 75m rptr - it's not needed.

You fail to understand that the fellows on there are a *tiny* fraction
of a percent of all licensed operators. How about focusing on the
good guys for a change?

Can you imagine the bottle-neck this NG would become if each of us
relayed our favorite HF QSO we heard onto here?

Given your focusing on the bad boys of 75, and at the same time having
high regard for the freebanders, it seems to me you envy criminal
behavior. Is that the image you want to present to the rest of us?
Are you really a closet-criminal? Are you proud of being what others
find disgusting? Do you have a criminal record by any chance?

73 from Hawaii,
Jeff KH2PZ

P.S. In that this thread is a policy issue, I suggest all folks
doing followups direct this to .policy; in the header just append:

From the back of my Tempo S1 transceiver: Receiver certified to meet
FCC Part 15 as of date of manufacture.

Heck, even my shortwave receiver has a label similar to that. So does
my TV set.

These devices are all unintentional radiators that radiate RF as long
as the device is powered up, so they should be regulated.

Funny that no such label appears on my amateur transmitters (as opposed
to the trans*ceivers*).

It's my understanding that commercially-built amateur transceivers must
satisfy type-acceptance *only* because the rcvr's oscillator is a Part 15
device.

In several of Burt's posts, he's said that his comments are in regards to
most hams. There are a lot of people who hold a ham license, but they are far
from being a typical ham. I know of a few that got no-code tech licenses for
the simply reason that it's a cheap alternative to cellular phones. They're
interest in ham radio ends there.

This is the best idea I've heard yet. The ARRL is hopelessly stuck in the past and is too indebted to the wishes of it's members (protect the CW requirements at any cost, even if it means the death of the hobby) to accurately and effectively reprensent the views of the amateur community as a whole.

I'm looking for somebody who can make the following equipment for
me.

Specifications

A serial-port transceiver set. That is 2 units, each connected to
a serial port.

eg1 = 2 computers connected together
eg2 = 1 computer with remote modem, or serial device.

1. Radio communications. Need to discuss range against costs.
2. Encryption. (Eg. Simple ic chips should do the job)
3. Error correction.
4. External power required as many serial devices don't deliver
power like a computer does to the port.

Also, I'd be interested in learning how it's done, as I hope to learn
some electronics/radio stuff in future.

Please e-mail all tenders to me at dyhec@wmin.ac.uk. Bear in mind
that I'm a student so I'm gonna try and barter on the price.

Even if you're not interested, could you try to point me in the
right direction, please contact me.

Thanks.

>
>I agree it is his right but it is not right.
>Can you understand this simple statement?

As I have stated down at least at the 5th grade reading level it is his
right and I believe it is also right ie. correct ethical moral. You
have the right to carp all you want about hams blah blah blah but no
one has an obligation to allow you to use their property to broadcast
your views. You seem to think you have some special "rights" because
you have a view counter to most hams and I don't think you do.

If I had a PBBS I would lock you out. Why, because if I had a PBBS it
would be for the benifit of amateur radio. In my opinion your tirades
run counter to the best interests of amateur radio thus counter to my
goals in having a PBBS ergo you get locked out. My equipment, counter
to my goals in providing said equipment, your gone. Simple enough for
you?

Burt you're nothing special and their is no reason that people should
go out of their way to accomodate your BS. In my opinion PBBS ops who
lock you out are providing a service to the community. When you get
like you have been the past week or so you are insulting demeaning and
a waste of bandwidth.

I noticed you once again spammed a number of news groups with your
tripe please try to forgive my triming the list. Perhaps you can defend
your spamming of all those non related newsgroups, i didn't think so.

>this organization mentioned the RFI filter/harness for the Lumina (GM#
>25027405) that no one that I talked to seemed to be aware of (at GM, Delco,
>or dealerships).

Humm... My car from Japan had this type of problem. Then the dealer put a
ham radio kit on the car. Noise gone! Will I ever buy an american car
again. NEVER! I have been converted.

It's the american attitude about building cars that I don't care for.
Take GM for example. This "blow off" attitude towrds the customer
sucks! The engineers at GM simply blow off a good customer who just wants
to use a radio. The folks in Japan create a working group. Isolate the
problem, then come up with the fix. Make a kit that can be used on the
car at a small price ($149.95) that fixes the problems for the
specialized customer. Will I buy a car from them again? You bet. Why,
they cared about my needs as a customer.

How do you fix your noise problem? Simple. Buy a car/truck from a
company that cares about the customer. That will make the extra effort
to fix your problem. Did your dealer come up with at least 3 options when
you brought the problem to there attention? Did a mechanic come off the
floor and offer any solutions?

It looks to me like the dealer sat behind the parts counter looking
stupid when you asked the hard questions. Sat on his/her ass and made no
effort to help you. Did not even offer to find a solution.

When I brought the problem up to my dealer, they told me right off hand,
"I have not a clue as to what you are talking about". "Give me 10
minutes". In about 5 minutes the floor supervisor came out. Wrote down a

complete description of the problem. Then faxed it to somewhere. They asked me to return on Monday to see what they can do. I thought to myself yha right. At 0900 Monday morning I received a phone call from the supervisor. He told me of 3 possible kits that where available, two of which did not come from the manuf. They where 3rd party kits.

My point is that this dealer went the extra mile for little old me. Never treated me as stupid and never talked down to me. They simply got the job done. I am sorry but I don't find that level of service from American car dealerships.

Hasn't happened yet. It will be the day that the courts rule the
government no longer has a compelling interest in requiring Morse code
proficiency as a condition of obtaining an amateur radio license. Over
the ARRL's tearful objections, the court will hereby render Morse testing
irrelevant, just in time to reverse the sagging numbers of amateurs and
save ham radio from an otherwise certain death.

As soon as the skip starts rolling in, the freeband will be just as usable as CB. The Channelmasters can't be heard because the conditions won't propagate, but as soon as the sunspot cycle picks up they will be out in force again.

Oh absolutely! 3853 has been by far the longest running red neck hangout in the world. These guys on 3894.5 just wish they could have the clout on 75 as the 53 bunch.

Do you remember a guy on there they called "Gay Sammy"? What ever happened to ole N4BNW? There was Garland from Irving N5EWD. There was "Dallas Carl" KD5LJ. "Lying Dick", KD5BZ. Also in the mix is "Tubby" from San Antone. "The grasshopper". I have many tapes from the 80's the are classics and was going to market them. Like the time when "Gay Sammy" N4BNW had a 6 hour long oneway QSO with the FCC monitoring station in Georgia about the letter he got from them for malicious interference on 3853.

He read the entire letter on the air and accused the guys on 53 of having the the FCC in their pocket.

All these guys are still here so thus makes 53 the king of the late night entertainment on 75 meters.

I enjoyed your article. There are some good points there.

> Taken together, the result is Amateur Radio Service that is becoming less HF
> centric. Yet we have a license structure where 5 out of 6 licenses have an HF
> centric focus.

If, for the reasons you gave, a large portion of the population cannot operate HF even if they wanted to, then what is this license restructuring going to do? It seems to me that there may be some short term interest but in the long run there will be almost no impact at all.

For those whose situation precludes HF operation, the Technician license is all they need. It looks like the restructuring is just an attempt to get more HF operators.

BTW, I agree that the current sub-bands encourage spectrum waste. All the traditional HF bands have 50 to 100KHz of very little activity. Even though I'm mostly a CW operator, I don't see why we need more than 100 KHz on any band for CW.

The lack of interest among young people in ham radio is not due to the licensing structure but the fact that it has lost the allure that it once had to likes of computers and the internet. We need to integrate those technologies with ham radio to compliment the strengths we do have.

As you pointed out in your article as did I in Op-Ed in QST last year, we desperately need high speed digital communications on our microwave bands.

If ham radio offered a good compliment of analog and digital technologies we'd have no trouble attracting plenty of new people.

> tape loops of burping and farting...all on one fine frequency?
I begg to differ sir. See, seeing how you are kind of new to all this I should point out to you that there is now way that on any given night 3894.5 is in any way, shape, form or fashion.

Look at the list of names from 53.

Tubby from San Antone
Johnny Rebel*
Frog
Lying Dick*
Gay Sammy*
Grasshopper
The Ham from Hell**
Coon-ass*
Dallas Carl*

* denotes membership into the 3853 hall of fame
** denotes hall of shame because they just don't know when to quit

The list is very long and distinguished, Sir.

I have respect for the entertainment "sometimes" found on 3894.5. But pound for pound, dollar for dollar the entertainment value found on 3853 is more than exceptional.

I would ask you to just once, tune your rig down to 3853. Go on. Give it a spin to the left and check it out.

4494. Morse Code

There's a lot of discussion over the use of morese code so I thought I would add my own two cents. Code may be old and outdates, being replaced by more modern modes such as RTTY, Packet, Amtor, and Pactor. BUT, the problem with these modes, and also SSB, is that adverse band conditions can seriously interrupt communications. Dont get me wrong, CW is not the all powerful, get through anything mode but it comes close. I have had many DX QSO's that never would have happened if not for CW...who can hear a SSb S-2 signal through +20 QRN??

I couldn't agree more. Check out 3853. They are the kings. Or 3950
for that matter. Most of the guys on 3894.5 are from north of the
Mason-Dixon anyway, so they are hardly from the "deep south". 3894.5 has
gotten quite boring for the weak non-entities that only get their
jollies from making the occasional unidentified stupid comment, or only
listen, now that the famous QRMer of 75 meters has called off the dogs
and has moved to 3901.

Your right. It seems very cut and dry.

I have often wondered that myself as to why this has not been done. Instead we
have a license structure that is, to my mind overly complex.
I suspect that any proposals of this kind will run into major opposition
from, for lack of a better description, the traditionalists of Amateur Radio.
It may be wise to include a two or three year non renewable license that allows
entry and my concept of a FULL TASTE of Amateur Radio. I would be interested
in your thoughts concerning the single license concept. Would you have CW
requirements? At what level would the theory testing be? How would you
assimilate all existing licensees into this class? Sometimes the first
thoughts on a problem turn out to be the best thoughts. I would hope that the
ARRL once having identified the present problems with the licensing structure
would be open to any and all proposals as to how to fix these problems.

Thank you for reading my post and offering your comments.

>a debate with you - since you are always right in everything you do, even
>when you are wrong. It's no wonder why hams have no access to much of the
>commercial radio sites. Think about it...

This personal attack is completely without merit and distressingly
out of place. If this is how you respond to challenge in a
technical discussion, then there is indeed no point to further
discussion with you. I am not always right, and I always wish
to learn, which is why I previously wrote:

So, while some radios are indeed not good performers outside the
amateur band, others are. The potential for interference that
type acceptance attempts to address is interference caused by
improper selection of operating frequency and mode, not dirty
emissions or poor receiver performance. Technical standards
for emission purity exist regardless of type acceptance standards.

If I am in error, please feel free to show me exactly where.

I'm not sure what "hole" I am supposed to be in - I'm not trying
to worm my way out of anything. I *was* trying to have a pleasant
discussion of technical facts - and you may note that I indeed
agreed with you, that *some* of the US amateur radio gear is not
designed for broadband operation. However, I have most certainly
seen US amateur radios that *are* designed for broadband operation,
and I don't think this puts me in any kind of hole.

Now, Mr. Wetzel, if you can turn off the "I'm right and you're stupid
and arrogant" flame mode long enough, please *show me exactly where I
am in error*. I must have made some serious errors indeed to lead you
to declare me an inept engineer, and I would like the chance to
address these errors. If you do not respond to this note, it will
be interpreted as a tacit admission that you are not capable of
carrying on a technical discussion without resorting to personal
attacks.

As for radio amateurs in commercial sites, the site owners I know tend to frown on radio amateurs primarily because of two things:

* Amateurs tend to act like they're entitled to a special discount on site rental.

* Amateurs tend to come tinker at the radio site, often bringing friends, and disrupt the equipment of the paying customers.

Now, maybe I'm wrong, but these are just my observations.

Carl,

Thanks for your thoughts. I agree that there is a good amount of bashing
the newcomer
and forced segregation going on in Amateur Radio today. It is my
perspective that in many
ways it was worse in the mid 60s when I was first licensed. However I have
to admit that
if I were licensed as a new no code technician or other entry level class today
i may find it more segregationist and mean than i did back then.

I used to feel exactly the same way you did about the ARRL. I really
believed that an
alternative would come into being. Back in the late 60s I belonged to
amateur radio club
that had a poster hanging in the meeting room. The poster said "ARRL
defination of a ham...
Extra Class license, Two letter call. I was really into what Wayne Green
of 73 magazine was
editorializing about back then. If you are not familiar with him, it will
be interesting
to read some of his stuff from the mid 60s through the mid 70s. I still
believe he
was correct about a lit of things then, and I believe he predicted some of
the problems
that the ARRL has identified today.

All that being said, I still believe that the ARRL is the only viable
organization
for Amateur Radio at this time. Otheres have tried to start rival
organizations, the
institute for amateur radio comes to mind, but no one has had any
success. In order to
change things for the better, we need to work within the system we have in
place.
(getting conservative in my old age)LOL

Thank for taking the time to respond to me post Carl
and best 73

>accurately and effectively reprensent the views of the amateur community
>as a whole.

>Where do I sign up?

Come on guys...why complain? The only reason one has to complain about the current license structure is that they dont want to have to meet the requirements. Dont take this wrong...This isnt a "flame" or anything degrading...its just my opinion. Whats wrong with learning CW...sure you may not want to use it but throughout life, I'm sure you had to learn things you didnt think you would need. I know I have...I'm in college and there's lots that I dont think I'll ever need but I still have to learn it in order to meet requirements for a degree. I have no problem with CW and think it should continue to be a requirement for HF operation. How else would we keep some people off the air. Think about it...if one is too "lazy" to learn CW, they will be equally too "lazy" to learn proper operating techniques. I was able to pass all of my tests and requirements in 9 months....when I was 13 yrs old. If I could do it then...Why cant the guys complaing now take the time and learn it...its not difficult.

Agreed. As I see it, the trouble with all the arguments on code/no code
ARRL=good guys/ARRL=bad guys, HR is going down the drain/HR is OK, etc. is
that everyone has a good point or two, but few are tolerant of disenting views.
I am all for hearty, even passionate debate. What I think everyone needs to realize
is that no one has a choice but to compromise. The "dumbing down" of licensing may
be viewed as somewhat inevitable. Why? Because so many people support this notion.
That is just a plain fact. Does that mean that the supporters of no/code can't
realize that the afficiandos would like to keep some parts of HR reserved for those
that are in it for the challenge rather than mrelely conversation? Some say that
HR will fade away if it is allowed to be a CB of the 90's. As long as the areas
reserved for those with the desire to experiment, try QRP, homebrew, etc remain,
there will always be a core of old fashioned hams. There is no reason to be
threatened by those that think differently as long as everyone considers the
other person's perspective.

I have a somewhat unique perspective: old ham coming back to the hobby. I
stumbled across some web pages with Ham information and got the urge to reinvolve
myself with the hobby I ignored through college, professional school, etc.
For me it looks to offer something more creative, interesting, and fun
than watching sitcoms at night. So WB8ZFV will re-emerge next month (I hope)
with a new call. I can't wait to try packet and am already looking forward to
the new sats this summer. The sunspot situation is annoying, but that will
be my excuse for buying a satellite rig. I am genuinely excited. I was saddened
to read the general class license manual and realize how much easier it is now
than in 1973. But, I've always wanted to go for extra anyway. HR has changed,
and WILL continue to change and there is nothing anyone can do about it.
Digital, satellite, the internet, even cellular phones have changed what HR
represents and what HR is used for.

Getting back on topic.....

Of the Little LEO group. So far Orbcomm is the only one to have satellites active. they are NOT spread spectrum either.

They are using BPSK down and FSK up on the consumer units.

Sound familiar? Several of the amateur packet satellites use this exact set-up.

To me, this makes it very clear why they would want our frequencies.

Dear readers,

This is the computer version of the GMDSS-training. It has the
CERIFICATE OF TYPE APPROVAL OF SIMULATE CENTER OF GMDSS.

It consists of the following:

* SKANTI MF TX/RX
* SKANTI MF/HF TX/RX DSC
* THRANE/THRANE TELEX
* THRANE/THRANE INMARSAT C
* DEBEG VHF DSC
* SKANTI VHF DSC
* SKANTI VHF
* DEMONSTRATION EPIRB and SART
* NAVTEX
* SIMULATION OF SAR OPERATIONS and COMMUNICATION EXERCISES

We also have demo version (size of it is about 2.5MB) and we may send
it to you if you are in interest.

Best regards,
Alexandr

Hey, Dave!

Ever hear the Ham from Hell? Does that guys cause more crap of what? You should have heard the other night when Lying Dick was trying to talk to him and the Fireman guy in Oklahoma wasn't going to let him talk to him. Did you hear that? Want a night! Like I said, 3894.5 pales to 53.

If you don't think so, I dare anyone with a "2" call to try and talk to them. That a good reason for them to fight!

Nice letter. Long. Very long. Where do you live at? I haven't seen any repeaters around here being closed of PL tines being changed. I believe every single club around here has had its membership swell with no-code holders and the ones I talk toseem to be happy with they have now and don't care about HF. I'm talking about the wife of the ham letting him know she's on her way home type of thing. There has been a huge number of women enter this hobby via the no code here.

Now, as far as the population of HF getting or growing old and these bands being vacated by death, that doesn't add up. Ever been on 40 lately? What about 75? You find me a place where you can operate above 3850 where you can hold a QSO and not plant yourself right between two on going QSO's with 3kc from either so can you predict that 75 will be vacated by members falling over dead behind their microphone?

4507. How long - License after test?

I know this must be an oooollllddddd question :) I looked for faq's on arrl, but to no avail for this specific question.

How long has the average time been from passing the test to being able to be on the air?

I read somewhere, I believe, that it has become much faster lately. The new operator being able to use the radio in approx. 10 days, being able to call the fcc and see what their call sign is. Eliminating all that extra time for mailing, etc.

> right, it is the type acceptance ID for that amateur radio

Hey, I'm a licensed amateur that can read, and better yet, I can actually
comprehend what I'm reading.

47 CFR 2.1005 refers to the procedure for type acceptance of gear used
in Part 97 service. Looking at Part 97, you'll find that the only
gear that requires type acceptance in Part 97 service are external
power amplifiers intended for use below 144MHz. In fact, 2.1005 even
explicitly mentions external power amplifiers and nothing else.

So, external HF power amplifiers have type acceptance IDs, but all
other amateur radio gear is not required to be type accepted. However,
much of the gear sold for Part 97 service *does* have an FCC ID# -
what is this number?

This number is the FCC ID for the equipment authorization required for
the *receiver* under Part 15. Depending on the exact frequency band, a
receiver may need some form of authorization. In general, HF amateur
transceivers require no equipment authorization. Gear intended for use
above 30MHz generally requires some form of authorization, often it is
verification or notification, in which a manufacturer simply sends the
FCC a form claiming that the product meets the relevant Part 15
specifications. No data or samples of the unit are provided to the FCC
unless the FCC specifically requests.

So, Mr. Gasta, you're apparently confused. Those little FCC IDs on
VHF/UHF do _not_ have anything to do with type acceptance. Perhaps you'll
whip out your copy of the CFRs and understand the difference between
the various FCC equipment authorizations. Then have a look at Part 15 and
understand what those FCC IDs you're talking about really are.

> If you would
> like to read parts 2.981, 983, 991, 993, 997, 999, 1001, and 1003, you
> will see just how much trouble Icsuwood had to go through to be able to
> sell you that radio frequency device, and if you want to build one for
> your own use, Part 97 allows that, just don't build them for resale
> without going through the same trouble. Like anyone with such a poor
> understanding of "ALL THE RULES" could ever build anything!

Um, who exactly are you talking about? 2.981,983, 991, 993, 997, 999, 1001 and 1003 are specifically concerned with the type acceptance of external HF power amplifiers for Part 97 use. This discussion *was* about use of VHF gear on marine/land mobile frequencies, and your citation is clearly not relevant. If you're going to become snide about "poor understanding of the rules", it would behoove you to first clarify your own understanding of the rules.

4510. Where to buy a Code/CW Key?

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-25 00:00:00 UTC
From: rharris@cris.com
Message-ID: <rharris-2502971525580001@user-37kb3tc.dialup.mindspring.com>
Source record: 203698

I'm just getting into amateur radio and I need to learn Morse code.

Can anyone tell me where I can buy a Code Key (CW key/telegraph key)?

Can anyone tell me what brands I should look for and what price range I should expect?

I'm thinking of getting a classic style key, rather than one of the horizontal automatic keyers (bugs?)

Also, what kind of CW transmitter/transceivers are good at a moderate price? What kind of wattage should I look for (what distance do you get with these?)?

What is the best way to learn Morse code? Radio Shack's video tape?

Any advice or words of wisdom would be much appreciated.

Thanks,
Robert

4511. Code is Fun

From: bb840@scn.org
Message-ID: <E66CpI.5t2@scn.org>
Source record: 203700

In a previous article, pajabrar@abcs.com () says:

>Firstly, this whole code/nocode debate. How many letters are in a
>word? I am quessing that it would be about 5, I assume that there must
>be some standard word length on the tests. At 5 letters per word 5
>wpm does not seem like too much to learn (a bit over one letter every
>2 sec) But something like 13 or 15wpm seems like it would be a little
>too fast for most people.

Yes, a word is considered to be five characters. I heard once that PARIS
is the standard length (in time required to transmit). Actually, the 13
to 15 wpm is not as much a problem as it sounds, because you reach the
point where you recognize the characters with out having to translate.

>Second this no code tech class, what can you do with somthing like
>that? What bands are you allowed to broadcast in (what is typical
>range and use of those bands)?

The Technician class license holder has full amatuer privileges in all
amatuer bands above 30 mHz. Range is generally line of sight, although
repeaters extend coverage. Also, conditions sometimes permit skip.

>At the current regulations what would someone gain by getting an
>advanced liscense opposed to just a novice class. I guess what I'm
>asking is what is out there to make it worth taking the extra tests?

The higher class licences grant additional privileges in the amatuer
bands below 30 mHz.

>Third, I assume that these tests are just for people who want to
>broadcast but do you need anything other than equipment to listen
>only? What are good things to listen to? I have read in Pop'Comm
>lists of foreign radio stations, pirate radio stations and other lists
>that I don't quite understand. When frequencies are listed are they
>in hertzs, khz or mhz. They are normally just 4 to 6 digit whole
>numbers. What do you need to listen to all of this? What is below
>500 khz that would make more expensive equipment worth it?

First, a matter of semantics. Amatuers do not broadcast. Broadcasting
is defined as transmitting to the general public. Broadcasting by
amatuers is prohibited. Amatuers are only allowed to transmit to
establish contact with other hams (although there is an exception for
code practice sessions and announcements of interest to amatuers only).
The frequencies you see will be either kHz (if there is no decimal point)
or mHz (if there is a decimal point followed by three digits). Now, all
that's needed to listen to the shortwave bands is a general coverage
shortwave receiver, and no license is required in the USA. Passport to

World Wide Radio is one of may sources regarding shortwave listening.

>Fourth, how othen do you need a TNC or MPC? Is it just for sending
>and recieving packet? Or can you/do you intercept other people's
>packets like military/gov? And what use is this information since I
>would assume that most of it would be encrypted?

I don't know too much about packet, so I'll leave that for someone else.
I will mention that encryption is not permitted in the amatuer bands.
All transmissions must be in plain language.

>To me the hobby seems like it would be rather fun, its just so
>confusing to get started. To be able to listen to radio from across
>the world would seem to be very educational. To tune in on the police
>and government among others would be fun. But is it worth the
>incredible cost? It would seem from what I have seen so far that you
>can't really do much for under $1000. A good TNC with lots of feature
>and formats like the Universal 8000 is like $1300. You need a big
>antenna on a big tower which would cost several hundred dollars. A
>transiever unit that has mutiple bands is about $1000. I have read
>that you can pick up used 2 meter units for around 100-150 bucks but
>what can do with one of those?

You can buy new shortwave receivers for anywhere from a few hundred to
several thousand dollars. Passport to World Wide Radio has a section
listing available in several categories.

>I seems to me that the problem that amateur radio has with getting new
>people involved is not really code (yes the higher wpm rate might weed
>out some but 5wpm seems like almost anyone could pass) but infact its
>the cost and confusion of what you need to get to have any fun in the
>hobby that is throwing people for a loop.
>
Probably the best way to find out more about amatuer radio is find an
amatuer radio club in your area. That way you can meet active hams who
can answer your questions face to face, and answer follow-up questions.

Good luck in your search for answers. 73 de KD7MK

> vacated by members falling over dead behind their microphone?

If only that could be predicted lol, However, the changing demographics of the situation seem to be inexorable. The HF frequencies are about full right now.. especially 40, 75, and to some extent 160. This is due more to the present propagation conditions though as 10, 12, and 17 meters are not presently useable a lot of the time and 20 is marginal. I believe what the ARRL committee has found corresponds with your statement about the no-code technician being very happy on VHF and having no interest in HF. They seem to think this is a problem, and if the no-code tech is the primary gateway into amateur radio, and they do not upgrade to at least General class, then it is just a matter of time until we see less and less activity on HF. There has been discussion of this since 1990 when a few demographic researchers with an interest in amateur radio began to make projections at to the activity level of the HF bands 10 - 20 - 30 years for now.

Many hams feel that with the lessening of activity on HF, operating will be a paradise. The flip side to that is the potential for takeover of the bands by other interests because they are not being utilized to a fuller extent.

I personally feel that if the no-code technicians had some access to lower frequencies, they would enjoy them as much as VHF and could become real contributers to what goes on there. Phone band congestion could be relieved by expanding into the CW segments which the ARRL committe has suggested because of a measured decreasing use of CW.

As far as the no-code technician being treated poorly, yes... I have seen it happen here (Kentucky - Tennessee area) I have also seen repeaters go private (closed) and the poor no-code guy get ignored. Of course, as I

said in the post, this is nothing new. When I was a novice, I experienced it also. (1964/65). Yes.. clubs have increased their membership because of the no-code technician, as has the ARRL to some extent. Please do not mis-understand me, I am not against the no-code license. I think it was one of the best things that was ever done for the person who wanted into Amateur Radio. I also think that these people should get some for real HF privileges.

Reasonable people can disagree, but I feel that the ARRL committee was correct in pointing out a potential very damaging problem to the Amateur Radio service. When you think of it, Amateur Radio is for the most part people communicating with other people, much as we are doing via posting in the usenet or e-mail.
It is interesting to note that as hi tech as this means of communication is, there are no restrictions on any of us as to where we can go and who we can communicate with.

Thank you for taking the time to read my (long) post and this (long) response.... hi

There is still time for non-Pack Rats to enter the 'Worked The Most Pack Rats" contest. Submit a copy of your Jan VHF SS LOG to W2SJ (was WB2YEH).

The winner is the station that has the most QSOs with Pack Rats. The Award is a nice plaque.

Attached is a text file of all the Rats that were in the contest, and the bands they have.

73, Dave, W3KM (former WA3JUF)

4518. Packet on HF / VHF

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-25 00:00:00 UTC
From: Ruehle <ruehle@freeway.net>
Message-ID: <01bc2366$73c296a0$444999ce@ruehle>
Source record: 203706

I am interested in joining MARS, and was informed that it is necessary that I have Packet or AMTOR, preferably on HF. This is actually fine with me, but I need to find out what is needed. I want to use the packet system for both HF and VHF. I have several C-64 computers and a Compac 286. I have kind of been told that I will be needing a computer and some type of interface, but I don't know what.

If anyone can help, I would appreciate it.

Gary Ruehle, KB8PQQ

There's a BIG difference, Dean. A repeater coordination means that you take up 2 channels, 24x7. Not fair if you don't share, IMO.

If we shut out newbies then the amateur service / hobby will die.

I've seen it be as short as 8 days -
Check the callsign server at the UALR (U of Arkansas @ Little Rock) -
They have daily updates -
Good luck!

>Is this frequency limit only in the US or is it also recognized in Canada?

According to a recent issue of "Monitoring Times" Canada will NOT move
stations into the expanded band. In fact they plan to abandon MW and
FM all together in favor of a band around 1900 MHz (I think).

One reason they gave for not going into the expanded band was few
Canadians owned received capable of tuning it. Well Canadian
Government, how many of your subjects own radios capable of tuning the
1900 MHz band?!?

Personally I don't think it'll happen. There's too much money
invested in MW and FM stations.

I haven't heard Dallas Carl on in a long time. He was a real wasn't he? I have been in tears and my side hurts after being there for just a few minutes with him around. Like the time in 92 just before the elections when Ross Perot went to speak to the NAACP. Do you remember that? What Perot said? He said: "Financially it's going to be a long hot summer right? And you don't need me to tell you who gets hurts first when this sorta thing happend, do I? You. You people. You people do".

Well, Carl's slant on this was to tell everyone on the band "here's what Ross Perot said that got him in trouble, wanna hear it?" So everyone said yeah. So Carl with his long Texas draw proceeds to say: "Financilly it's goin to be a long hot summer right? And you don't need me to tell you who get hurts first when this sorta thing happens do I? You! You niggers do. You niggers do".

I was in tears.

Just look for fund. and harmonics of the H freq. Be sensitive and
selective. To do this
reliably is beyond the scope of this newsgroup! It is not easy!

>
> > Could a device be designed that would jam them?

Nah, a 450 HT with a rubber band around the transmit switch, placed right
near the
camera, does the trick most of the time. At least it did until I shielded
the heck out
of them...

Does anyone have the various opcodes, et al for the IC-706 CI-V interface? I was thinking of whipping up a Visual Basic application to back up my radio (and the one that's posted to oak.oakland.edu/pub/hamradio/arrl/bbs/programs doesn't work properly, at least under NT 4.0) to disk, and maybe implement some other functions. Any information would be appreciated.

>
>--Mark

I agree, George is asking good questions. You can see more such questions at
our web site http://www.hamradio-online.com

I think the HF versus VHF/UHF split is occuring for just a few reasons:
1. Nearly all homes built in the U.S. during the last 20 years have
restrictions that prohibit outside antennas. That pretty much rules out HF for
a huge part of the population.
2. Here near Seattle, growth management laws require new housing to be "high
density". The result is most new housing appears to be condos, townhomes and
apartments. Again, not much oppty for "serious" HF operation.
3. In two income families, which tend to be the norm today, particularly for
anyone under 35 - there's not time for spending hours engaged in a hobby like
ham radio except to the extent that you can partake of ham radio while doing
something else. If you do get involved in ham radio, its almost more for
pragmatic reasons - like keeping in touch while on the go!
4. Younger people just entering the housing market can't find single family
detached housing with a decent yard - the kind of place where HF antennas can
be erected. The result is that if they have an interest in radio, its going to
have fit into their life and the realities of 1997.

Taken together, the result is Amateur Radio Service that is becoming less HF
centric. Yet we have a license structure where 5 out of 6 licenses have an HF
centric focus. Seems to me that Amateur Radio is no longer in synch with the

rest of the world around us. We can't change society so we may have to figure out how we fit into the new world.

Burt wrote this
>That some how makes it morally right?

There is no moral issue here. You want to spam the world and annoy
people and expect others to supply you with the resources to do it.

Wait a minute Burt you may have a point!!

Now that I look at it that way, it is a moral issue, and they are right
in denying you access to their equipment. You want to carry out
activities that they do not approve of, so they have every right moral
legal and ethical to deny you. Thank you for pointing this out

Jerry

BTW I just had to reduce the spam factor a bit the nice folks in space,
digital, homebrew etc. don't give a rat's back end about your tirades.

Some "people" never learn. Some are stupid. Some just like hearing the sound of their own voice. Some have no heart. Some are cowards. Some are jerks. Some have no class or style. Some have their heads so frimly planted up their keesters, that they fail to see the light of day. Some have the sense of a bag of hair...

THEN THERE'S BURT !! - WHO HAS THEM ALL !!!

I have tried to bury the hatchet with this sociopathic incubus. I even sent him a nice little note about his family. I think the pictures on his web page are forgeries, folks. The rest of his family looks like normal people .. like you and I. Maybe Burt, the devil incarnate, put a spell on his wife? Anyone know a good excorcist? har har...

All Burt is really about, unfortunately for him, is throwing gasoline on fires that aren't even lit. Here is "the simp's" latest attempt at flame throwing:

You have all seen the vile profanity that N5NY posted here (Bob Adler),
the asses in North Texas easily re elected him as SM.

Uh huh. "Profanity" is in the mind of the person hearing it, you anal retentive, self righteous boob. It only has "impact" on those who take it seriously. On "regular" people, it has the same effect as water on a duck's back.

Yes, indeed, they did. By close to a 60% plurality! What was the last thing anyone elected you to, Burt? Queen of the ball? Har har !!

I never much liked Texas, has anyone else?

I never did like jerks much. Anyone else?

Alaska rules.

Who cares? For all I care, Rhode Island can "rule" as long as it ain't Massa chew sheets. (that is the Southern pronounciation ... "sheeeets", lmao !

I don't agree that "This kind of overt segregation does not exist to any
great
extent today" ... I've heard similar (and worse) many times WRT no-code
techs.

> The limiting factor with this approach is the international treaty
> concerning the code proficiency requirement for operation in the HF
range.

No, the limiting factor is the ARRL's intent to keep forcing code on
everyone
without regard to the technical/spectrum-economics realities that the
service
faces ...

> Is there any way around this without having the amateur fraternity tear
> itself apart with another code, no code debate?

Doesn't seems so ... all we can hope for is that we get the needed
changes before the ARRL kills ham radio completely ... I firmly believe
that this will take the formation of a rival organization that can capture
more than the pitifully low percentage of amateurs that the ARRL
claims as "members" ... (and from my observation and many, many
comments others have made, a large portion of what the ARRL calls
"members" are really nothing more than "subscribers to QST" who
tolerate the fact that the ARRL doesn't represent their interests, but
still want to receive QST ...

> would have this requirement.

The novice class has been iminently unsuccessful in recent years with some
3 out of 4 novices dropping out of ham radio, rather than "upgrading"
(learning
faster code) ...

1) they don't listen ...
2) they don't care ...
3) we need an alternative ... the ARRL is THE most negative influence
ham radio is saddled with today ...

Jeff ... shame on you! You're a smart boy ... and you know that the delay
between Bob's writing his post and your receiving it is due almost entirely
to the "store and forward" nature of USENET and the time interval that the
news servers are programmed to observe between "feeds."

I'd hate to think that you were *deliberately* trying to misslead folks
into
thinking that modern, digital communications are somehow "slower" than
CW ... after all, deep down inside, *even_you* know that's not true.

That may all be true, Keith, but you *haven't* worshiped at the altar of
the god Samuel Morse ... so, they still think you're a "heathen."

Too bad *they* don't have a clue as to what's *really* valuable and
important ... that's why ham radio is in such dire straights ...

The same rules that allow us to build our own also allow us to
modify or otherwise adopt any radio for use on the amateur
bands. There have been hundreds/thousands of Motorola
radios pressed into service on amateur radio by hams.

Just for a little while longer ... Morse operations are supposed
to be discontinued soon at the remaining coastal stations.

SITOR, INMARSAT, and GMDSS have rendered it obsolete
(just like the Coast Guard said when they dropped all Morse)

I have a Jackson Model 598 dynamic tube tester, that doesn't have any tube data on its internal roll for tubes later than about 1960. I need to be able to test newer audio tubes. I know that this updated info was made available periodically, but I don't have it. Can anyone help me. Thanks. Please email me with guidance.

> That would be even more of a challange. If they are wireless linked, you
> could jam that. But handling the general case would be unlikely.

Well... If you can figure a clever way to disguise it; How about
a high-powered infrared emitter? Most of those little camera
"buggars" are sensitive to infrared light, and this would
probably "saturate" it (ie: shine an invisible light in it's
eyes)

However, others near by may wonder about your "warm"
personality...

Why do you believe "the price of entry in terms of licensing
requirements
would so high"? I have proposed such a license before as I believe has
Gary Coffman and perhaps several others. I'm still waiting for a
reasonable
rebutal that shows why more than one class of license is needed. I can
see a case for a limited class license (primarily limited in terms of
power based upon safety concerns) to allow younger amateurs a viable
entry path into the service. But beyond that, either you know how to
safely and correctly operate an amateur transmitter on the amateur bands
or you don't. Seems pretty cut and dry.

PS Nice post over-all!

4556. Pactor-II vs HAL

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-25 00:00:00 UTC
From: Tobias Port <tport@vector.wantree.com.au>
Message-ID: <33129F7E.473D@vector.wantree.com.au>
Source record: 203753
Cross-posted to: rec.radio.amateur.digital.misc,rec.radio.amateur.digital,rec.radio.amateur.misc

I was slightly annoyed when I discovered the official statement in the packet radio network written by Bill Henry, the president of HAL Communications Corp. (manufacturer of the CLOVER system) putting down PACTOR-II, which is a competitive product manufactured by SCS in Germany. Is
HAL so concerned about their market share that they need to initiate a "battle" in the amateur radio world and spread such a bunch of accusations?

In the last couple of months, several comparisons between CLOVER and PACTOR-II have been published. Whatever the source was, all serious tests
showed that PACTOR-II actually performs better. This may appear somewhat embarrassing, but it is the truth. For example, just see the July 96 issue
of the QST magazine which includes a comparison from the National Telecommunication and Information Administration (NTIA) in the US. There should be no doubt that these results are unbiased, especially since the authors claim that the findings were used by the Federal Emergency Management Agency to determine which protocol could be used in case of an
emergency. Another comparison with similar results was published in the November issue of the QST. I also talked to several people, and everybody
who really compared both modes considered PACTOR-II to perform better, and
that is also my own experience. A friend of mine mentioned a test setup which he used to check the performance of both systems: He used two transceivers with ten watts HF output each that were connected to two dummy
loads and two modems. A third transceiver, which was connected to an antenna, was used to transmit white noise. When using two CLOVER boards, which were linked over the residual HF radiation of the dummy loads, it required 8 Watts of the noise transceiver to break the link. When using CLOVER-2000 (the commercial 2 kHz 8-tone wide band version which is also mentioned in the HAL file), only 4 Watts were required to break the link.
When he used two PTC-II units instead of the CLOVER hardware, he was not even able to break the link with the maximum noise power of 150 Watts, and
traffic was still going through! This is of course no standardized test, but
it is easy to reproduce and clearly shows the relation of the robustness

of
both systems. Due to such personal tests and especially due to the
comparison of the performance of both systems in real band conditions,
more
and more people change from CLOVER to PACTOR-II. For example, the entire
store&forward traffic of the world-wide WinLink BBS system, which used
to be
done in CLOVER, is currently switched to PACTOR-II. A similar
development
can also be observed in the commercial field. So that's what the
customers
REALLY say, and that's what performance REALLY speaks. One day,
everybody
will realize which of both units performs better, especially since there
is
no relevant improvement of the HAL software. For example, the CLOVER
hardware is still only able to operate the same few modes, to say
nothing of
the simple construction which hardly allows any significant improvement
of
the performance due to the limited processing power. The latest firmware
for
the PTC-II however, which was released just a few weeks ago, provides
another two new modes (FAX and SSTV). Therefore, why not REALLY let the
customers decide instead of putting down a competitor's product? If you
also
want to hear the other side after reading Bill Henry's statement in
packet,
just check the Internet pages "http://www.scs-ptc.com". The latest
PTC-II
firmware can also be downloaded there for free.

Many items in Bill's proclamation represent his personal point of view
or
just contain speculations, and have thus nothing to do with objectivity.
Although it is entitled "SCS claims vs reality", there are several items
that can be proved to be wrong, in addition to its disreputable note.
Here
are just two examples:

Obviously, Bill Henry is not aware of the details on how PACTOR and
PACTOR-II really work (although HAL has implemented PACTOR-I in their
own
units; maybe that's why the performance of their implementation is so
poor):
The data compression can NEVER lead to an expansion of a file, as a full
PACTOR implementation always compares the original file size with the
compressed one, and if the "compressed" one is larger, as in case of
rare
characters when using the Huffman encoding, the original data is
automatically being sent. This means that the advantages of utilizing

any
other, more powerful compression can be used in the same way as with
CLOVER,
but CLOVER does not include ANY automatic data compression whereas
PACTOR
does. How do you want to apply an individual data compression when you
are
connected with a mailbox? And how will you make sure that the traffic
can be
monitored by a third party - which is not only a requirement of the
amateur
radio regulations but also most desirable when looking for a QSO partner
-
when utilizing an individual coding? Virtually all modems (including
phone
modems, etc.) nowadays include an on-line data compression, it is thus a
"must" for any up-to-date technology. How can it be an advantage not to
offer this feature? The on-line compression mode provided in PACTOR-I is
matched to plain text, which is transferred most frequently. It hence
already represents a basic standard for all systems. PACTOR-II even
includes
six different on-line compression methods in addition to the run-length
encoding, and automatically applies the most effective one.

A still more important item is the comparison of the simulator tests. To
justify their assertion that CLOVER provided a similar robustness as
PACTOR-II, HAL supposed that SCS had used 500 Hz bandwidth instead of
3000
Hz as they did, which would - according to HAL - lead to a better result
for
the SCS units. This shows that they have not even understood the very
basics, as in this case the results for PACTOR-II must have been much
worse!
If you spread the noise over 3000 Hz to disturb a signal with a
bandwidth of
500 Hz, the effect will of course be much less than if you concentrate
the
same noise power in the small bandwidth of the "target" signal. This
means
that, if SCS had actually done the tests in the way as Bill Henry
claims,
PACTOR-II would still work in conditions with an SNR down to minus 26 dB
when using 3000 Hz noise bandwidth rather than only down to minus 5 dB,
as
HAL concluded. This is a nice example of their "know how". How can these
guys seriously talk about any simulator measurements? As you can see in
their publications, SCS of course also did their simulator tests
according
to the CCIR standard. This means that you do can compare both
measurements,

and that PACTOR-II is really able to keep a link and transfer information in
conditions with an SNR down to minus 18 dB, whereas a CLOVER link already
breaks if the SNR falls behind minus 5 dB.

This message is not considered to be an assault on HAL. The intention was
just to correct some of their "facts". I have known this company for a long
time. They developed nice equipment already many years ago, and I still
consider them to be honest. Nevertheless, each digital operator has to
decide for himself which mode he prefers (and should be able to do so). On
the other hand, it is not my intention to prevent people (like me) from
telling their personal opinion. However, it is surely no good policy of a
company to put an affront upon a competitor in the international packet
radio network. Therefore, I hope that such "statements" will not happen
again.

He was my HS Algebra and Religion teacher, Fr. Mike Reaume, W8RBL
We still write from time to time. Even decades after I left
High School, he's still helping to shape my religious faith.

> DX

2 DX stories:

My second QSO outside of North America was VK3MR, named Snow,
55 km from Melbourne, NSW. I was running a DX-20 into a
raingutter antenna. This was in 1978, so the rig was ancient.
It was on 40 meters at about 2AM my local time. I was so thrilled
I never forgot the callsign, even after I had 200 countries
confirmed. I heard him just a few months ago, and we had
a nice QSO (this time with a KW and a decent longwire). He
sent along a photo of his place in VK-land with his second QSL.

I once worked a pile-up for San Marino (I forgot the callsign)
for 20 hours. It was awful. The station was associated with
a charity, and the operators changed-off every couple hours.
This was on 20. It so happened that I had a sked with my
brother (KM8Z) and cousin (KF4HH) on 15 that day, and I thought
of the sked as _taking_a_break_ from ham radio to have some
fun. It was so nice and quiet on 15! I eventually got the
station in San Marino.

> Antennas (what you've used and how it worked)

I worked 105 countries with the rain gutter and a (then-ancient)
DX-20. After that, I graduated to the aluminum window
frame in a high-rise apartment and a KW. This was in
Cleveland, OH, and it had a nice lobe into EU and Northern
AF. Now I have a 200' longwire that really shouts on 80 meters.

> What you used as a kid in Ham Radio

My novice rig was an NC-188 receiver, and a DX-20. Going from traismit to receive took 2 actions: turn the RF gain on the receiver all the way down (it then served as a sidetone), and hit the high voltage to the transmitter. Then the key was active. (I didn't run SSB until I'd been a ham for about 15 years.) I later
went on to modify ARC-5's. They were WW II aircraft radios. I also built the 811-A 200-watt linear from the Radio Amateur's Handbook. It worked to spec, but it had a nasty habit of blowing the power supply diodes. It took 8, and they were stacked as 2 strings of 4 in series. If one couldn't take the back EMF, they all went out. A very expensive proposition for a high school student!

The DX-20 and the NC-188 saw service while I was a grad student in Virginia 10 years later. After I got my PhD, I bought an ICOM 2AT with my _very_first_real_paycheck, and upgraded to an ICOM 740 HF rig and a Heathkit SB-221 linear a few months later.

You are welcome as is anyone to contact my students (dormouse1@juno.com
or my daughter at aurora24@rocketmail.com) and ask them for your self.
Foul language? I used ass, report me. You no doubt have seen the vile
profanity used against me? When compared to the public at large I am
indeed an ass but when compared to hams I am far superior than MOST.

Can you tell me just what
> exactly it is that makes you a better person than any of these people
> you speak so poorly of?

I do not call my wife THE WIFE or my daughter a harmonic.
I have a life, I care about other people, I have guts to name just a
few.

I also pride myself on being a volunteer
> interpreter for the deaf, a volunteer for the American Legion, an

No need to pray for them, ask them if they need your prayers.
Hams are not equals, all others are or are superior than I.
Just how am I bigot?

No one here has the intellect to deal with my students OR THE GUTS.

4571. Re: Freebanders

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-25 00:00:00 UTC
From: cwowen@aol.com
Message-ID: <19970225140601.JAA14175@ladder02.news.aol.com>
Source record: 203768

Maybe these are a sign of the times. Maybe it is time to change some old ideas for a new modern world.
I am working on my Tech ticket now, but I don't really want/need the code. I have had to be around code for ten years in the military, and truthfully I can't stand it.

I would like to see the spectrum open up a bit, but I would also like to see more self control on the 11 meter side.

There is nothing going on at AEA, they are out of business due
to cheap hams who want something for nothing and expect that world is
made to serve old fat white men (hams).

Yes it is a bad frequency but I worked quite a few stations on it when
newsgroup users could have been there. On 7208 I worked k6xd, K1vlx/4,
N3WMC and on 3910 I worked KB2ZZK and N2GFB at the times I mentioned.

4579. Unanswered FT-50 Questions

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-26 00:00:00 UTC
From: lem@datatel.com
Message-ID: <856997663.23822@dejanews.com>
Source record: 203477
Cross-posted to: rec.radio.amateur.misc,rec.radio.amateur.equipment,rec.radio.scanner

Greetings,

I normally don't send unsolicited e-mail, but based on all of my reading I and still have FT-50 questions.

Would anyone with knowledge please take a few minutes and see if you can answer any or all of my questions. (Some are elementary and some are very technical, but any help is appreciated.)

My radio has the following serial number sequence: 6L130292 (but I've been told this doesn't matter)

My Radio has "freeband" mod: (de-solder blob "1", remove resistor "A" above blob 1, pwr on with lamp/knob,press FW, pwr off, pwr on with lamp/ptt/knob, change BAND=A* to BAND=FREE, pwr off, pwr on)

My Questions"

1. Why cant I get my radio to go back into "BAND xxxxxx" anymore, it did it one time during freeband mod? "I am interested in going back to see what the A1, A2, and A3 settings do, and if I should have createdtemplates for each of these? I assume two of them are EURO(s) and one is US configuration of the radio, if so does anyone have the template files (.TPL) for the three of these they could send me (if my assumption is wrong - - what are they and are there more, and can you send me template files for all of them) ? "I am also interested in getting to the INTERNAL SYSTEM ALIGNMENT so I can adjust the signal strength meter. I knew I read this somewhere, but YAESU said there was no such capability, help me???

2.
What are the various differences in the versions of the ADMS-1C software? (for example version 1.05 won't let you enter out of band frequencies [200-300 and cellular] even though you have done the FREEBAND modification, but version 1.04 will allow entry of out of band frequencies). Would having an older version(s) of the ADMS-1C software do anything for me, and which versions should I get my hands on (and how can I find them) ?

3.
How can you get the all VFO and HOME memories programmed into the radio from the ADMS-1C? Am I doing something wrong, are these a part of a template file (.TPL) versus a radio file (.RDF) ?

4. Would someone be kind enough to send me the following .TPL files via the regular mail (address below): • a standard US template [pre modification / out of the box configuration] • either or both European templates(EURO.TPL) with a desc of what each does do • any other templates that do anything off-the-wall, neat, or special [send with descriptions]

5.
Can someone tell me what each of these lines in my WIN.INI file do for the ADMS-1C?

```
[FT-50 Programmer]
AllowAnyFrequency=0
Calibrate=2909
Com=1
DataDir=C:\YAESU\FT50
TemplateFile=C:\YAESU\FT50\FREEBAND.TPL
UseTemplate=1
```

What happens if I start changing values of "AllowAnyFrequency", will that open it up so I can do the out of band frequencies via the software, and if so what value do I use (I have tried 1 and null, neither work) ?

What does the "Calibrate" do, and what are my options for values here?

6.
Is there a users guide or some detailed instruction manual that anyone has written for the ADMS-1C?

7.
Is there a power on button sequence that will reset the microprocessor without clearing memories?
Is there a power-on-button-sequence that will reset the microprocessor AND clear the memories?
What are all the different power-on-button-sequences and what do each of them do?

8.
Is there a mod for receive in the 25-75 MHz range ?
Will the radio receive VHF low band if I add 45.1x 2 to the desired frequency ? (ie. 52.250+90.2=142.450)

9.
Is there a mod for TX (or RX) in the 220+ MHz band ?
Is there a mod for TX in the 800/900 MHz bands ?

10.
Has YAESU printed new (revised) manuals for the FT-50 yet, I heard they were going to ?
Is there an advanced users manual yet (similar to what ALINCO did for the DR-599/600) ?

11.
What happens when you turn off the CPU clock shift function ?

What would this be used for, scanning via some sort of computer like
computer aided scanning ?

You can get on the air for less than $100. You can get on the air with
fairly good equipment for less that $500. You definitely don't need
a beam or a tower to get out with a big signal either. You can get a
decent used TNC for about $200 (no Clover or Pactor II). Look around.
Check out the swap and antenna NG's for used gear prices. If you build
your own gear you can really get by without spending much money.

I agree with you on the appliance operator and abandoning
learning/experimentation aspects. However, I don't think amateur radio,
in general, has pushed the state of the art since before WWII.

BURT, I sorta hate to burst your bubble, but your steady flow of BS has
been steadily rejected on the packet network - what makes you think your
presence one either Internet or the ham bands is likely to be any more
successful? Do you often trip over your own ego and hurt yourself?

James W. Kelley wrote:
>
> For a single class of license to be workable without lowering the level
> of qualifications dramatically, the test would be enormous.

I'm not sure what this means? The basic premise is that you are
qualified
to operate an amateur radio transmitter or not. The current scheme
allows
a novice or technician class operator to do that. All that is gained by
proving additional "qualifications" is more bands/modes, or in the case
of novice stations, more power. What fundamental difference is there
between operating a 1500 watt six meter station and a 1500 watt twenty
meter station? Yet one requires answering a mere 70% correct out of
55 questions, while the other requires answering 70% out of 80 questions
and passing a 13 WPM Morse Code examination. Shifting gears to the
general and extra class licenses, one requires 13 WPM and 70% of 80
questions, while the other requires 20 WPM and 70% of 170 questions.
A rather significant difference, yet the general is allowed to
operate with 1500 watts OOK Morse Code at 14.025 MHz but not at 14.024
MHz.
What sense does that make? If he's qualified to operate at 14.025 MHz,
he's certainly qualified to operate at 14.024 MHz.

> A rather big
> chunk to take all in one bite. This might have a counterproductive
> affect. Secondly, without a system of upgrades, it becomes more
> difficult for the service to demonstrate that it fulfills the Part 97
> mandate for promoting self improvement, etc.

Part 97.1 (which covers self improvment) is not a mandate. It is
the basis an purpose. Making Part 97.1 a mandate and hence require
all operators to fulfill all clauses of it would require all
operators to be members of ARES or R.A.C.E.S. organization,
participate regularly in DX, further the state of the art, etc.
In fact, amateurs are free to contribute to any or all of those
aspects of amateurs radio, and not required to perform them
all.

> For classes of license based on power output restrictions, well, it's

How is it more or less enforceable than the current 1500 watt
limitation?

> I agree with the basic ideas being tossed about here, but see real

I don't know about better, but certainly one that deserves attention.
Another clear focus should be antenna restrictions, either government or
contractual. Those more than anything else are likely to dramatically
alter the future of the amateur radio service. HF operation may soon
become the playground of the rural amateur and a place only dreamed
about by the urban amateur.

Go to INTERNET RADIO RESOURCES http://www.visi.com/~fubar/radiowww.html
then to FTP then HAM (AND DX). From there to MORSE/. My personal
favorites are codet20s.zip and codep40s.zip There are many others as
well.

Hi Joop,

Forgive Burt... he always has a comment...a stupid one usually, but
always a comment.

And yes I am sorry to tell, AEA is out of business. I have no idea yet
what will be done about support for their products, some rumors but no
real information.
As for Burt, you gotta ignore him, he's like the crabgrass on the
lawn of rec.radio.amateur.misc and the other ham groups.

If you have read the Ham Radio On Line E-Zine or kept track of other sites, ther is a proposal to change the names and requirements for licensing. Very interesting proposal.
10 WPM for General, the Tech+ to get a lot of SSB on the bands. A lot of changes. What do people think of this? Looked pretty good to me.

I use Netscape and it's newsreader. Is there anyway that I can filter
out certain subjects/individuals from having them show up in my reader.
If not can you reccomend a news reader that has this facility.

I am not denying individual's right to blow hot air. As far as I am
concerned, their argument is lost at the outset by posting it to an
inappropriate news group anyway. This last posting reminds me of "Oh you
are so good at milking cows. I wish I could do it as well as you do."
The only problem is someone doesn't know a cow from an ass.

Thank you for your help with ther news reader.

No apology is necessary. The poster that made the original comment is a
racist and a bigot, both of which have NO place in amateur radio. I
mean, look how closely he associates with the lowlifes on 75, and lets
never forgot his comments concerning the riots in Florida last summer

Great, I can hear it now. The S-meter police knocking at my door
demanding to see my station, and asking me to explain how my signal was 2
S units higher than it should have been. If I owned an amplifier, I think
I would live in greater terror of the big angry neighbor from down the
street complaining that he couldn't watch his female full-contact Karate
match, than I would from the FCC trying to enforce power restrictions by
monitoring my signal level from some remote location. Look how much
success the 4 watt limit on CB radios has enjoyed! (or the 1500 watt
amateur limit for that matter).

>IMO, in a few years (after the CW problem has been solved) two classes
>should be sufficient, with the main difference being the output power
>(and perhaps limit the secondary bands to the full license).

I like the idea, but I don't think the regulators will. The power rule
would be too easy to violate without detection. Violations of the frequency
rules are blatently detectable, and much more difficult to dispute.

In order to get the radio back into the "master set" (my term) mode, You will need to reset the "a" vfo to 144.000 and the "b" vfo to 440.000, no pl, no offset on either. hold down the top knob, ptt and lamp, and power up. you should see band+free. If you turn the knob, you should see the settings hssi, s1, s9, and so on. these will allow you to set the squelch sens, s meter and so on. if theat is what yaesu told you, they are lying. btw, If you power up with the vfo, the settings are for vhf. try switching to uhf and changing the specs. I set low pwr 1 to 10 mW to drive transverters.

> 8.

I dont think so, but i'll try it with the service mon.

> 9.
> Is there a mod for TX (or RX) in the 220+ MHz band ?
> Is there a mod for TX in the 800/900 MHz bands ?
>
>

The radio will tx + rx in 220. tx pwr is 22 mW, rx sens is 3 mV for 12 dB sinad. pretty poor, but great for testing used 220 ht's at flea markets. No 800 tx, But the second harmonic of 440 freqs shows up quite nicely on a service monitor (hi).

> 11.
> What happens when you turn off the CPU clock shift function ?

>should and will route around them.

Sounds like you have the U.S. Post Office and ham radio confused.
The big problem with the packet network is sysops who don't pay
attention, forward anything to anywhere, loose mail by letting things
sit on their system forever, etc. Running a BBS is something that
requires a) time and b) effort, and too many packet BBS's consist
of a TNC, a radio, a computer with BBS software that somebody's
buddy set up, and a ham running around patting himself on the back
calling himself a 'sysop'.

>If you're not part of an open network, you're just cluttering up
>valuable space on the bands, and are giving jerks like Burt more
>ammunition.

I think you have that backwards, too. I don't know who the first two hams were who hooked up TNC's and BBS software, but I imagine that the intent of the first link of the 'packet network' was to forward information, not garbage. Keeping the network free of garbage reserves valuable space for valid information to be passed.

The amateur packet radio network already forwards, by design, an incredible amount of garbage in the form of message headers. I don't recall the exact figure, but a few years ago I analyzed a months worth of ALLUS bulletins, and I think that headers accounted for between 40 and 50 percent of the total character count. Add to that garbage a totally unnecessary ASCII drawing at the end of every message, a few lines of advertising from the guy who wrote the whiz bang terminal program used to generate the message, and top it off with an ACK at the end so the receiving system generates a totally unnecessary return message saying the mail got there, and you run the percentage of garbage up well over 50%. The packet network does a wonderful job of diseminating garbage, but unfortunaly falls flat on it's face when it comes to delivering mail from one ham to another ham.

I agree one hundred percent with Steve. I supplied the two computers, three radios, three TNC's, assorted power supplies, cables, antennas, etc. that are used to run my packet BBS and DX cluster. I pay the electric bill every month. When the little red transmit light on one of my packet radios turns on, I decided what gets transmitted, and it damn sure won't be Bubble Head's Bible Quotes or daily birthday lists from the Happy Club. Steve chooses to keep certain people off his system. I choose to keep certain garbage off my system. We are both doing what we are supposed to be doing, monitoring and eliminating garbage.

My packet equipment isn't a 'public service'. It's a service provided for hams to use in relation to ham radio. Bible banging and birthday lists have nothing to do with ham radio, so I make the decision to keep that junk off my system, and not contribute to the confusion by sending it to other systems.

When you, TAPR, or the ARRL decide you would like to reimburse me for the cost of my equipment and start sending me a paycheck, I will be happy to revert to your system of not excluding anything from my BBS.

By the way, Burt's messages pass freely thru my BBS, as his topic of discussion always seems to be ham radio related.

Regarding Burke Baumann's message, it was very good. Perhaps I should had done the same thing when I was in this debate! In any event, anyone who's in the commercial radio service knows better than to modify amateur radio equipment for other radio services. It is poor engineering practice for a person to do so. I Thankyou Burke for your time in putting that together.

My son took his test last February on a Saturday. The following Wednesday
morning before he left for school, his call was on the UALR Callsign
Server. On top of that, the Monday in between was President's day - a
day on which the FCC did not work!

RC users who operate in the 50-54 MHz band are required to have an
amateur radio (ham) license. Many RC operators get their Tech tickets to
avoid congestion on other (no license required) RC frequencies.

Start checking the callsign servers on the web about 4 days after the tests
are passed. If you find your callsign listed you can go on the sir. Do a
search for your name. Try www.qrz.com and there's another I forget the address
to.

Well, I tried again Burt, but after 5pm EST, 7.208 is virtually usable
due to SW broadcasts and 3.910 had a great deal of interference from
adjacent operators. Perhaps a 20 meter frequency (provided propagation
allows)

Might be interesting to see if the spoken Burt is the same as the written

Abandon FM? That seems a little drastic.
Perhaps Canada is interested in going to digital radio because of their vast land mass and relatively few people. I am sure there are many areas that are too remote for easy reception of the more urban AM stations, but not large enough to economically support a local radio station. Does digital radio in the 1900 band travel greater distnaces with better audio quality than regular AM or FM?

: : Amateurs. What are all numbers saying?

: I can tell you why. It is the same reason that the majority of new Hams are
: No code Techs. People are lazy, and generally will do no more than absolutely
: necessary to do what they want. That means a CB radio for many people, where
: the only effort required is spending some money.

NOOOO!... one reason is that many new hams are not interested in
ancient CW, and simple sideband communications. The frequencies below 30
MHz are of no interest to those whose technical interests and/or skills
exceed those of the "barney rubble" era hams. The Tech class hams wish
to communicate in crystal clear FM... wish to communicate with
sattelites... wish to utilize amateur television..... The Tech class
doesn't wish to deal with some ancient technology that will die with "ye
old fahrtz"#"

Accept new technology or be swept away.

Guys, this has been a really interesting thread and I've learned a lot
reading it but there's one thing I'm not clear on and that's what's
meant by the term "Gaussian Noise Distribution"...is this referring to
what is basically random or pseudo-random noise, white noise, pink noise
or something else entirely?

Please pardon my asking but I'd really appreciate an explanation on this
in as basic terms as possible (without over-simplifying).

Thanks,

Speak for yourself, but the only real reason I got back into HAM radio IS to experiment with Telemetery from my High Power Rockets. It is all scrach build stuff. It sure cost less if I can implement a ready to build kit into the design however!

I want to play with satelites, so I may purchase a All-Mode "Appliance" largely because you cannot beat the cost to performance ratio.

I am learning code to up my license before the ARRL twist's the FCC's arm. I really do not find code all that relavent to radio. I DO like being able to build a CW station from very little and for very little money. The certainly justifies CW, but 13+WPM, for what?

Just my thoughts

At least one and possibly several questions on the tech exam deals with controlling model aircraft. There is no requirement that one have a ham license to fly model aircraft...except when done in the 50 Mhz band where a tech license has been required ever since I started flying in 1968.
The suggestion that he is a bootlegger when engaging in a legal

activity is without merit.

Jeez, John! Ease up on the guy!

Lots of modelers got Tech licenses to use the 50 mHz RC allocation (and
avoid the crowding on the usual 72 mHz band). He's no "bootlegger."

Here's a guy who wants to expand his ham radio horizons. Let's welcome him
and give him a hand.

I guess this is the first time you've heard this. It's been going on for sometime now, perhaps as long as a year. I hear them here in California almost everyday. They've also invaded the lower 10 KHz or 40 and 30m. I assume they are doing it on purpose as there are plenty of other frequencies to use where no one would notice. Occasionally it has been possible to persuade them to QSY. ;-)

You ought to hear the signals out of Southeast Asia at the bottom of 40m at our sunrise. Some days the band is almost unusable.

During the previous sunspot low (1986) the Australians were telling us that the East Asian taxicabs had taken over 10m. Sure enough when we got propagation back there were these little signals every 5 KHz across the phone band. After about a year the activity picked up so much that we drove them all away. It will be interesting to see what has happened this time.

Well what I think is code is OUT OF DATE! BUT I think it's a part
of amateur radio and SHOULD STAY a part. As fare as it keeping TRASH off
amateur radio I think 14.313 is a good point, CBer's still get by CODE OR
NOT! I for one will never UPGRADE if thats what I HAVE TO HEAR! If I want
to hear CB'ers with a HAM LICENSE I'll find another way. I like the
internet better then HF anyways. if I don't want to hear TRASH I just
change IRC Channels. :) Till the FCC is given some money to clean up the
TRASH OFF the ham bands. I'll just stick to Internet, Packet, 2 meters,
440 and 6 meters. The code really is not why people don't upgrade. it's
the COST OF HF Gear. I think buying a computer is better then buying a
1500.00 HF radio. I can talk all over the world on the internet with NO
TRASH, or QRM. FCC or NOT. on the web have the power. On Amateur radio I
don't. I have to the TRASH if I like it or not. :(

4628. Internet with Ham radio and DirectPC

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-26 00:00:00 UTC
From: Khalid HASSANI <aplog@micronet.fr>
Message-ID: <33146062.5976@micronet.fr>
Source record: 203591
Cross-posted to: rec.radio.amateur.misc,alt.satellite.tv.europe,rec.video.satellite.dbs

Hi Everybody

I want to know if someone has tried to connect to Internet using
DirectPc as a downlink and Ham radio as the uplink.

DirectPc : www.directpc.com is a service of Hughes Network, which
broadcast IP via satellite, but you still need a modem and an Internet
provider to send your packets.

Khalid Hassani

Yes, I can't afford both HF and Internet. it cost to much for HF
gear. Plus all the TRASH on it.

> and in rec.radio.amateur.policy. Why must we endure it here instead of
> talking about other aspects of the hobby. I enjoy just plain old
> ragchewing with folks,

That's all I like Amateur radio for. I love 2 meters and if the
code is droped will never upgrade for one it's to costly and QRM. :(
That's why most of the one's I talk to say. 1,500 + Dollors for a HF Gear.
plus all the QRM. Also all the 14.313 people on HF just don't do it for
me.

> but for now, ragchewing on vhf/uhf fm is about all I can do here.

I love 2 meter's and 440. Packet radio. 6 meter's. I only talk
local to my friends and LOVE Amateur radio. Unlike CB where you have all
the QRM, TRASH people like on 14.313 ect.... I never have noise like on
CB or HF. that why I got into Amateur radio and all my friends too. I also
like the fact there's no DX too. Only local people. :) SO that what I
think. Now if people like DXing and all more power to them. I think local
is the ONLY way to go. I use Internet to talk all over the world and I
don't have the problem with TRASH people.

I do think CODE is AMATEUR Radio and should stay. As for me I
don't care for HF. So thats why I don't upgrade. Not becouse of the CODE!

People,
You are missing the point! The object of newsgroups is the free exchange of ideas and information, just like ham radio is supposed to be enjoyed. Not by ignoring peoples views just because you don't agree with them. That is what makes the United States of America GREAT!
Not censorship!
You don't like don't logon or turn off your radio.

4631. Techician's Exam Questions

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-26 00:00:00 UTC
From: Steve <sporter@Traveller.COM>
Message-ID: <3314082A.6BD4@Traveller.COM>
Source record: 203594

I'm preparing to take the techician's exam, and something is a little unclear to me. Is the technician's exam a seperate exam from the novice exam? In other words, will I take two exams-the novice + the technician?

Also, is Rat Shack's "Now You're Talking" a good study guide (that's what I'm using). I'm also using a couple of sites on the web which generates exams. Are there better materials? I'd rather not attend a formal class.

So far, so good. The part about learning all the different priviledges on all the different frequencies is giving me fits, but other than that I think I'm gonna make it :)

Well I'm a worker of MOSI in tampa, FL. Ham station. I never knew
HAM RADIO was going to the CB'ers till I tuned into 14.313. I SEE CODE
STOP THEM. When I did some kid's came into the HAM SHACK and I turned it
off very quick. after one said a %$FKL word. I then told the kids I hit
the wrong knob and got the CB Band. Now how can I talk people into HAM
RADIO if this is what there going to hear. After all the work of learning
CODE and ect. What's WHY I SAY 14.313... IT"S the NEW CB CHANNEL 19 after
the trucker's run them off..

Yes. The novice written exam and the Technicain exam are two separate
tests. You must pass both to get the Technician license.

>

This book is published by the ARRL and sold through Radio Shack. It is
a good book that explains the "theory" part of ham radio as well as does
a pretty good job of overviewing the different things that you can do
once you get licensed. Make sure you study the questions in the back of
the book. Questions that are on the actual tests will come from this
pool of questions with no change in wording (although the ordering of
the answers may be changed).

> So far, so good. The part about learning all the different priviledges
> on all the different frequencies is giving me fits,

Look at the test questions... For novice, they only ask you about
novice privileges. Same goes for Tech. You don't need to memorize the
whole chart!

but other than that
> I think I'm gonna make it :)
> --
> ***sporter***

Hang in there. Its a fun hobby with more to do than most of us have
time for! Good luck on the testing.

4634. Origin of 'California Kilowatt'

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-26 00:00:00 UTC
From: bill harris <billharr@pop.flash.net>
Message-ID: <5f1roo$7ho$1@excalibur.flash.net>
Source record: 203597

Anyone who has been around amateur radio for any length of time has probably heard the term 'California Kilowatt'. This term generally refered to certain West Coast stations known for running 'high power', thus any amplifier capable of running this 'high power' was refered to as a 'California Kilowatt'. I have often wondered just when this term orginated and I may have stumbled upon the answer. Point your browser to the URL below and check out the item CALIFORNIA KILOWATT and let me know what you think.

>license and perhaps power steps beyond that make a great
>deal of sense. It seems that the USA is the only (or one of the
>only) countries which has subbands based on license class.

I agree with both you gents on these issues. I see the major problem
with implementing each being as follows:

For a single class of license to be workable without lowering the level
of qualifications dramatically, the test would be enormous. A rather big
chunk to take all in one bite. This might have a counterproductive
affect. Secondly, without a system of upgrades, it becomes more
difficult for the service to demonstrate that it fulfills the Part 97
mandate for promoting self improvement, etc.

For classes of license based on power output restrictions, well, it's
basically unenforceble. It's easy to figure out if someone is operating
in a part of the band they are not licensed for. But try figuring out if
he's operating with the power output he's licensed for! Skill level and
transmitter power output scale with one another more logically than any
other set of privileges, but it seems unwise to set ourselves up for a
situation which invites non-compliance.

I agree with the basic ideas being tossed about here, but see real
difficulties implementing them without considerable modification to the
intent of Part 97. Attacking the arbitrary technical limitations which
have been imposed on our allowable modulation schemes seems a better
target of our focus. If the ARRL is not receptive to calls for change,
then the FCC Wireless Bureau is the best place to direct ones
correspondence.

If we are to persevere well into the 21st century, we must be allowed
greater technical agility. We have seen some excellent ideas and areas

for advancement discussed here in recent weeks - primarily wrt the digital domain. We must be allowed to experiment! Providing access to the spectrum for the experimentors is part of the equation, the other is being allowed sufficient technical lattitude by the regulators to have some chance at success in advancing the state of the art. These are separate issues, and each must be pursued independently and with equal vigor in order to affect the necessary changes.

73,

Jim AC6XG

>It is your right to pass or not pass as you see fit. In general I agree
>with you Burt looks much worse for his posts. However if a sysop
>chooses not to pass anti ham propaganda that too is his right. After

Correct. I agree with and support this right. However, just because
you have a "right" does not mean you have to exercise it. After all,
you have a "right" to make a fool of yourself, too. Remember, power
corrupts, and once you start censoring what goes through your BBS,
you'll find all sorts of excuses to filter out anything that annoys
you.

>all you guys supply the time, equipment, location and expertise we all
>enjoy thus it is your foot ball and you make the rules. Most reasonable
>people would accept this but then Burt is not reasonable.

And if all the Sysops who find various things unreasonable start
killing them, the network collapses. If you don't want to be part of
a free-flowing information net, then you have no business setting up a
BBS on such a net. Put your little up-tight closed BBS off on some
peripheral channel, and lock out folks to your heart's content.

I repeat: It's legal to lock out folks like Burt (or me - it's
happened more than once) but it's not ethical, nor is it in the spirit
of Amateur Radio. It's hard to overemphasize the importance of this
principle.

Hint: How far do you think the Internet would have grown if it
catered to the same sort of censorship that some hams practice?

Yes, I will also say! if the code is droped, Amateur radio WILL
end up like the CB! For the FCC and the ARRL are not doing there part
now to keep Amateur radio CLEAN. Just think how it will be with NO CODE AT
ALL. For I know if the code is droped ALL the CBer's will become Ham's and
bring all that CBing with them. End of story!

Code is out of date for uses by the Gov. But this is our blood
line and should be ALWAYS! I can learn code if I wanted to with no
problem. Now if you have a Hearing problem then that's another story. Code
is not why people don't get into amateur radio. I know lot's of people
that have upgraded to HF and love it very much. But after all that you
have to buy a 1,500 rig. The older rigs don't have the newer recv.
(Bandwith) so you can't use them anymore. Unless you buy something to
overcome the problem. Plus I don't care for all the QRM. See on 2, 440,
and up you don't have all the QRM. Witch is what I like about VHF and UHF.
I also love packet radio too. the other problem is all the TVI and
restrictions on ANT's. And some on! Face it and get REAL. It's not CODE
that stop's people.

I don't care to invest into a band that's going to be like CB!
it's already happening now with CODE. :(Just think how it will be
WITHOUT! Thank about it!

How about a magnesium flare, or a thermite bomb. It would only work briefly,
but it could be enough for a dastard to do his dirty deed.

I guarentee you that if the CW requirement were eliminated for HF
access, and everything else remained the same, that the SSB portions
of the bands would be flooded with people who get 'instant upgrades'
by memorizing the question pools.

The original poster was correct. CW is a challenge to most people.
Most people do not want to exert the effort to rise to the challenge.
The Japanese were dead on when they referred to Americans as 'lazy'.
Our budding welfare-state mentality, the huge influx of 'get rich overnite'
claims on the 'net, and the sharp rise in personal injury lawsuits all
show that Americans want everything for nothing.

>relayed our favorite HF QSO we heard onto here?

My favorite QSO had to be my 3rd contact the day I got my license.
It was with a ham in PA, on the 80 meter novice CW subband. I would
say it lasted over 3 hours, with me sending lots of ditditditditditdits,
but I really enjoyed it.

That contact is one reason why I almost exclusively operate in the
novice subbands when I do work CW. There are always people looking
for a chance to talk to someone who doesn't mind a terrible fist.
Someone has to be there to help the newcomers get their code speed
up. Unfortunately, when I listen on 80 these days I hear less and less
activity than I did 5 years ago.

The ARRL Letter
Vol. 16, No. 7
February 14, 1997

---

* Address changes: Kathy Capodicasa, N1GZO, e-mail kcapodicasa@arrl.org.
* Editorial: Rick Lindquist, N1RL, e-mail elindquist@arrl.org.

IN THIS EDITION:

* Speak up! Little LEOs target 219-225 MHz!

COMMENTS NEEDED BY MARCH 4! ARRL OPPOSES LITTLE LEO EFFORT TO INCLUDE 219 TO 225 MHZ

Commercial satellite interests seeking access to bands below 1 GHz--including amateur allocations at 146 and 430 MHz--now have added 220 MHz to their "wish list." For the first time, Little LEO (low-earth orbiting satellite) interests have proposed including 219-225 MHz in their list of desired allocations for the non-voice, non-geostationary (NVNG) mobile-satellite service (MSS). The move was contained in the industry's so-called "flexible allocation proposal," delivered at the February 13, 1997, meeting of FCC Informal Working Group (IWG) 2A. Little LEO targets now include 146 to 148, 219 to 225 and 430 to 450 MHz. The ARRL and AMSAT were among those objecting to the concept, and the League is urging those who agree with their position to comment to the FCC by March 4. IWG-2A has been preparing draft proposals for the 1997 World Radiocommunication Conference (WRC-97). These will be reviewed during a March 5 meeting of the FCC's WRC-97 Industry Advisory Committee that is preparing draft proposals for consideration by the United States as it gets ready for WRC-97

The ARRL and AMSAT statement said the latest proposal affecting amateur allocations in the 219 to 225 MHz segment came "at the last possible moment" and "without any technical support whatsoever." The League and AMSAT pointed out that the little LEO proponents have had more than a year to complete a technical study of the possibilities of sharing with the amateur services in the 144 to 148 MHz and 420 to 450 MHz bands. "They have not demonstrated compatibility for sharing these amateur bands but over the evolution of their document have proposed various 'new ideas' for use of these bands."

The little LEO flexible allocation strategy for WRC-97--submitted as IWG-2A/86 (Rev. 6)--is to propose broad allocations. The apparent theory is that most administrations would find reasons to oppose little LEO use of specific bands in the crowded spectrum below 1 GHz, but that a broad allocation would permit different implementations in different countries

depending on local circumstances.

At the February 13 meeting, a coalition of spectrum interests--including land mobile, amateur, broadcasting, and military--opposed the flexible allocation concept on three grounds: that the concept is simply an invention to avoid performing technical sharing studies that would demonstrate the unfeasibility of sharing; that it is inconsistent with decades of ITU allocations practices; and that, if adopted, the concept would be counter to US interests. The coalition document is identified as IWG-2A/107.

The ARRL and AMSAT submitted a further statement of opposition, citing the absence of any technical studies that might support sharing with the amateur service or the amateur-satellite service and pointing out that the little LEOs have completely mischaracterized the nature of ITU Resolution 640 regarding the use of certain amateur bands in the event of natural disasters. The ARRL/AMSAT paper, revised to reflect opposition to the late proposal to include 219-225 MHz, is identified as IWG-2A/108 (Rev. 1).

Amateurs also might find interesting the comments of the Department of Defense, identified as IWG-2A/101 (Rev. 1). These address the 430 to 450 MHz segment the Little LEOs seek to share.

Anyone wishing to register support for the ARRL/AMSAT submission should send a brief e-mail message to wrc97@fcc.gov. The Subject line should say "Reference No. ISP-96-005 IWG-2A." A simple statement to this effect, "I support the ARRL/AMSAT opposition to the NVNG MSS flexible allocation proposal," will be included in the public record and will help to drive home the point that there is broad-based opposition to poorly conceived sharing proposals.

Please note! The proposals the League opposes are not FCC proposals, nor are they endorsed by any other branch of the government. They are industry proposals. The League's objective is to demonstrate there is broad citizen opposition to the industry proposals, so the government will not adopt them as US proposals. So, please don't "flame" the FCC if you comment.

Additional arguments or evidence also is welcome. Important! Comments should reach the FCC no later than March 4, 1997!

The complete ARRL/AMSAT opposition statement and other comments will be posted by February 15 on the ARRLWeb page, http://www.arrl.org/ under Band Threat News.

Not really. It seems the Canadian model is working quite well.

>This might have a counterproductive
>affect. Secondly, without a system of upgrades, it becomes more
>difficult for the service to demonstrate that it fulfills the Part 97
>mandate for promoting self improvement, etc.

Then how is it that almost (maybe all) other countries operate
on that basis. Indeed, before incentive licensing in
the mid 60's, so did the USA except for novice and tech.

>For classes of license based on power output restrictions, well, it's

>other set of privileges, but it seems unwise to set ourselves up for a
>situation which invites non-compliance.

I would see a power level for general set at 200 or 250 watts.
That'd allow all commercial rigs except for power amps.
I really think that anyone who wants to run 1500 watts
PEP should be an Extra. Indeed, the power limits
seem to work OK elsewhere. As to frequency subband violations,
that can happen today. Unless you look up my license in
the FCC database, there's only my 1x3 call that sez anything
about my license and that could be as low as a technician
with only VHF privledges yet I am an advanced.

>I agree with the basic ideas being tossed about here, but see real
>difficulties implementing them without considerable modification to the
>intent of Part 97. Attacking the arbitrary technical limitations which
>have been imposed on our allowable modulation schemes seems a better
>target of our focus.

I think that can also be another area to extend privaledges
instead of subband frequency allocation. Good suggestion.

> If the ARRL is not receptive to calls for change,
>then the FCC Wireless Bureau is the best place to direct ones
>correspondence.

Except, as most are well aware, the ARRL does wield
significant influence and without it, the effort becomes
a real hassle.

As long as the difference in allowed output power for the limited and full license is sufficiently large, say 10 dB, this should not be a problem. If it is suspected that someone is operating at illegal power levels, the (preferably near field) signal strength is recorded. Upon inspection of the station, the transmitter power is turned up until the same signal strength is observed and the transmitter power output is measured.

If the maximum power for the limited class is set to 100-150 W on HF, most solid state rigs fall below this limit. There is quite a lot to explain why there is a tube linear amplifier connected to the station setup. If the solid state rig can not produce the same field strengths as previously measured, there is even more to explain.

IMO, in a few years (after the CW problem has been solved) two classes should be sufficient, with the main difference being the output power (and perhaps limit the secondary bands to the full license).

At least some of these cameras use IR lighting to be able to see in
the dark
So an IR detector sohoud warn you in SOME cases.
Bllinding camera's with high level IR may not be so simple as they
usualy have auto diafragma.
Black spray paint the room, that will also cover the lens, but not
necisarily for IR.

: There's a BIG difference, Dean. A repeater coordination means that you
: take up 2 channels, 24x7. Not fair if you don't share, IMO.
:
: If we shut out newbies then the amateur service / hobby will die.

Bob is absolutely correct when he says that if we exclude the ones who are new to the hobby, then the service will die! I remember that at one time I became interested in this particular hobby, because of the opportunity to deal with people who were making things happen in the communications industry.

I remember listening to people talk about things that were added by amateur which enhanced general communications. Things like repeaters, digital communications, and the likes. Unfortunately, this never happen any more... People are content to go and buy some off the shelf equipment and call it a day.

Unfortunately for the service, it is because of this mentality which has allowed Commissioner Hunt to successfully conduct the auctioning of frequencies which were once ours. I can see in the not too distant future a period when the amateur service will have no dedicated frequencies at all.

It bothers me whole heartedly when I see all of these closed repeaters. I have been very surprised over the years that the commercial companies really took a jump on the Amateur service when it comes to digital trunking. To me, digital trunking would be the next logical step and would allow for the efficient use of repeaters. Of course this is just my opinion.

Afterall, I guess maybe, the technical skills are no longer present to motivate the service to be cutting edge once again. This is not aimed at those experimentors who are on the cutting edge, but the numbers of people out there who are just content to have a quick conversation. I wish that I could be a part of what made amateur radio magic from 1920-1970.

>technician being very happy on VHF and having no interest in HF.

It's probably more the result of not having HF equipment at
all. As a new ham on VHF, why would that person invest
in ham gear for HF when the license is for 50+ MHz.
It is only recently thatsome HF rigs have now added 6m
and even 2m to their coverage.

> They seem
>to think this is a problem, and if the no-code tech is the primary gateway
>into amateur radio, and they do not upgrade to at least General class,

>HF. There has been discussion of this since 1990 when a few demographic
>researchers with an interest in amateur radio began to make projections at
>to the activity level of the HF bands 10 - 20 - 30 years for now.

As before, without the HF equipment, there isn't the natural
desire to upgrade as there is if you are on one section of
80m and want to get into the advanced or extra segments.

>Many hams feel that with the lessening of activity on HF, operating will
>be a paradise. The flip side to that is the potential for takeover of the
>bands by other interests because they are not being utilized to a fuller
>extent.

While the threat to HF has not yet been seen, I think it is naive
on the part of many to think that no one wants our HF frequencies.

>I personally feel that if the no-code technicians had some access to lower

This is an excellent point and is further supported by the hundreds
of other countries that make no lass dstinctions on subband allocation
basis. The concept of restricted power for an entry level
license and perhaps power steps beyond that make a great
deal of sense. It seems that the USA is the only (or one of the
only) countries which has subbands based on license class.

Hilarious, but when did FACTS ever deter a rabid ANTI-CODER like you?

He he he!

mnmaniac@aol.com (Frew who describes himself as a "SCANNER FREAK") whistled
a happy tune like:

|>>To all Ham radio operators,

|>>I am putting together a collection of ham radio stories, like what
|>>is the best thing that has happened to you or someone you know that
|>>involves ham radio. What is your favorite story?

|>Hasn't happened yet.

WHAT 'hasn't happened yet?"

Your response is a non-sequitur to the question being asked here friend!

|>It will be the day that the courts rule the
|>government no longer has a compelling interest in requiring Morse code
|>proficiency as a condition of obtaining an amateur radio license. Over
|>the ARRL's tearful objections, the court will hereby render Morse testing
|>irrelevant, just in time to reverse the sagging numbers of amateurs and
|>save ham radio from an otherwise certain death.

1) The ARRL represents the opinion of the majority of hams, that tey do NOT
want the code requirement dropped.
ARRL doesn't MAKE this policy, they got it from surveying hams, so you are a
yapping minority!

2) SAGGING NUMBERS? In case you haven't noticed, the numbers have DOUBLED
recently from about 250,000 to over 500,000 - HARDLY sagging, pal!

Drew, I don't expect a "Scanner Freak" to know much yet about ham radio, but
stick around and you will learn. It is a GREAT hobby and I love it!
I even owned a scanner for a while but I got bored with it!

Well, if you don't like the code, then 27 MHz is there for you!
The No code license is fine if you only want to barely get one toe in the
door of amateur radio. If you wat REAL RADIO (HF) get a General or better.
It's not that hard, and even if you are not going to do CW, it is worth it!

the
> rest of the world around us. We can't change society so we may have to
figure
> out how we fit into the new world.

You're exactly right about the nature of the problem, but you seem to not
fully
comprehend the scope ... it's FAR more than "HF-centric vs. VHF/UHF" ... it
has to do with the fact that the ENTIRE service (except for a minority) has
1) become appliance operators, 2) abandoned learning/experimentation,
3) taken the viewpoint that "it's just a hobby and competitive sport is
its'
raison d'etre, and 4) allowed the ARRL "leadership" to keep us stuck in a
situation where the regulatory focus is based on the technology of the
1950s
and before, rather than pushing the state of the art like ham radio *used*
to
do ...

You're also right that we can't change society ... we need to accept the
fact
that the world is changing and adapt to that by keeping current with our
technology and increasing our spectrum efficiency dramatically or we'll
lose
our bands to commercial interests who will serve many orders of magnitude
more users per MHz than we do now ...

Hi. I have a Tech. class license that I've been using for the past 4-5 years for radio control of model aircraft.

I'm interested in getting into some of the other aspects of HAM, but I'm not exactly sure just what types of activities are available for this type of license. I would appreciate some information, or references for some of the things I could do at this level.

Thanks for the info!

>
> For those whose situation precludes HF operation, the Technician license
is
all
> they need. It looks like the restructuring is just an attempt to get more
HF
> operators.

I don't buy the idea that the majority of folks are "precluded from HF
operation."
They may not be able to erect stacked monobanders for 20m and the like,
but they can operate HF ... they just need to operate smarter, using better
techniques that don't require huge amounts of TX power and antenna gain.
(and are less likely to interfere with their neighbor's shitty consumer
electronics
gear)

Second .. we need more HF operators as well as more VHF/UHF/microwave ops.

> The lack of interest among young people in ham radio is not due to the
licensing
> structure but the fact that it has lost the allure that it once had to
likes
> of computers and the internet. We need to integrate those technologies
with
ham
> radio to compliment the strengths we do have.

Carefull ... the procode fanatics will lynch you for spouting the heretical
ideas that modern technologies should be brought into, incorporated into,
and encouraged in ham radio ...

> As you pointed out in your article as did I in Op-Ed in QST last year, we
> desperately need high speed digital communications on our microwave
bands.

We could also desparately use more spectrally efficient techniques than all
of
those VHF/UHF repeaters using "narrowband" FM at 20-30 kHz channel widths.
The commercial folks that got 220 are using 5 kHz channels VERY
successfully.
AND they've received praise from the FCC *Commissioners* for it ... mobile

radio
standards have just been changed to promote narrowband technologies by
changing the type-acceptance requirements ... and we're looking worse and
worse.

> If ham radio offered a good compliment of analog and digital technologies
we'd
> have no trouble attracting plenty of new people.

Not if we continue insisting on forcing Morse on them ...

> right now..

By what measure? The HF bands could be used FAR more effectively ...
Gary and I have each proposed systems that could support many times
the present numbers of hams in simultaneous QSOs wilt less interference
than current systems ... the beepers reject them out of hand ...

If you're saying "the bands are full and we're doing the best we can do"
I would assert that you're VERY wrong on both counts.

> I believe what the
> ARRL committee has found corresponds with your statement about the
no-code
> technician being very happy on VHF and having no interest in HF.

I would submit that many no-code techs would rather stay where they are
than
endure the "hazing by Morse" that current ritual demands for access to HF.

However, given the opportunity to communicate and experiment on HF without
having to endure that useless torture and waste of their time, I'd bet that
many
would happily pass more difficult written tests and begin contributing on
HF.

>Personally I don't think it'll happen. There's too much money
>invested in MW and FM stations.

The Canadians are, in fact, rapidly moving MW stations to FM. They seem to routinely grant applications by MW stations (private or CBC) to move to FM when frequencies are available, and the MW frequencies are usually deleted. There have been exceptions. (in some cases, other MW stations have moved to the frequencies left open, which basically has the same effect. In one other case, a new license was granted for the abandoned MW frequency.) In Canada, stations are not allowed to sell their old frequencies.

The move to 1900MHz (I'm not certain that frequency is right, but it's in the right general area) digital radio will take time. However, a pilot transmitter in Toronto is expected on the air this summer. It's hard to tell what will happen with receivers. No other country is currently doing digital radio in this part of the spectrum, but pretty much *every* other country (except the USA) is talking about it.

I think it's a 50/50 chance whether it flies. Depends on how long the USA keeps procrastinating about DAB here. But MW is, in fact, gradually dying in Canada.

Grundig YB 305 Yacht Boy World Receiver

(Read review of this portable at:
http://www.rnw.nl/en/pub/rxshop/yb305.html)

* MW, FM and SW (continuous up to 21850 kHz)
* PLL Synthesizer
* 30 Station Memory (10 memory channels for mediumwave, 10 for FM stereo, and 10 for favorite shortwave channels)
* Digital Direct Tuning tunes in 5 kHz steps on shortwave. There are two tiny switches in the battery compartment which let you select 50 or 100 kHz tuning steps on FM, and 9 or 10 kHz tuning steps on mediumwave
* 5 kHz selectivity
* Rated high in sensitivity

Excellent condition

Includes soft case and Radio Shack AC adapter

Yours for only $ 85

Includes UPS Ground *COD*

Please e-mail interest (not to newsgroup) to:
stacoma@ix.netcom.com

Will post immediately if sold. If I have not replied immediately and no notice that I have sold unit is posted, then I am talking to buyers in order of response. Thanks.

I'm the fellow who wrote the progam that is on the ARRL site. I
appreciate you're bringing this problem to my attention. Frankly,
I was mistakenly under the impression that anything written in
Visual C++ 4 for Win95 would also run on NT. Somehow this appears
not to be the case. I had the same problem that you did running
this under NT.

So I thought perhaps if I recompiled it under NT it would run. No
dice. However, what I did discover was that the only problem that
I can find appears to be directly related to the thread which receives
data from the radio (when I enter a command on the screen it goes
to the radio just fine). Fortunately, the entire block of code
that handles data coming from the radio is only a couple of dozen
lines long. So it should be possible to fix this fairly easily.

In the meantime, most of the codes that you need are in the
706 manual itself. My recollection is that the only ones that were
missing were the ones that commanded the radio to report it's status.
I had a paper here somewhere on the subject; I'll attempt to find it.

Anyway, thanks again for pointing out the problem.

Hi Tom

Tom I think part of the confusion here stems from the assumption that the only approval granted by the FCC is "Type Acceptance" and this is what is associated with the FCC ID number found on electronic devices. It also is assumed that this approval is related to the appropriate part of the FCC regulations for a particular radio service, in particular Part 97 covering the amateur radio service. These are both basically bad assumptions with the exception that some amplifiers for amateur service require type acceptance.

First in addition to "type acceptance" the FCC also issues several other types of "APPROVAL" including "Certification", "Type Approval" and "Notification". If you look at the ads for the ICOM IC-756 before it was approved it said waiting "FCC Approval" and nothing about "Type Acceptance". Also as I will show the "FCC parts" that the radio is tested to for approval may not in all cases be the same "FCC Parts" for the service the radio is going to be used in. This is not to say that an amateur transceiver does not have to meet Part 97 but that the "FCC approval" was not based on the part 97 requirements but instead on "part 15 " of the FCC regulations.

I own an ICOM IC-756 and waited several months for the FCC to "approve" this radio. During this time I repeatedly checked the FCC database to see if it to had been approved. (301-725-1072 for those who are interested. It might be a clue about the ft-920)

I apologize for the long attachment that follows. This is a capture file
from a session on this database.
It shows that the IC-756 approval was for a "notification" and was approved
under "PART(S) 15". The device was listed as a communications receiver
with a note that it was an amateur transceiver. Included in this file is a
definition of the fields in the report. Also included is a document
"MARKETING REGULATIONS FOR RADIO FREQUENCY DEVICES" that also contains info
about approvals and a document "Extended Coverage High Frequency
Transceivers". This last document covers use of amateur equipment in
services requiring equipment that is "TYPE ACCEPTED". It also states
"Transmitters designed and intended for use only in the ARS must comply
with the applicable technical standards contained in Part 97 of the
Commission's Rules but are not required to be
type accepted.

Data Element Definitions

The following data elements shown in applications records are derived
from
the data listed by applicants on the current edition of FCC Form 731 and
rule
sections governing the specific class of equipment.

Application Date - Date of Applicant Certification by
authorized
signature on Form 731.

Emissions Designators - Pertains only to type accepted equipment, and
certain notified transmitting equipment used pursuant to a station
license.

Equipment Class - Derived from the particular rule sections specified
in the rules governing the particular class of equipment.

Expiration Date - Applicable to certain types of equipment as specified
in
the Rules. Equipment cannot be manufactured or marketed after this
date.

Frequency / Frequency Range - The frequency or frequency range the
equipment
is authorized to operate. Pertains to all equipment with the exception
of Class B Computing Device Peripherals.

Frequency Tolerance - Pertains only to type accepted equipment, and certain
notified transmitting equipment used pursuant to a station license.

Grant Date - Date of Grant as specified on the most recent
authorization
issued by the FCC for the specified FCC Identifier.

Grantee Name/ Address - Name and address of the applicant as it appears
on Form 731 and as listed by applicant/grantee code in the Commission's
records.

Note Codes - Two character codes used for referencing specific notes
which
apply to a grant as issued by the FCC. Notes can be referenced in
the
Note Code Definition file on the main menu (Selection #2).

Original Grant Date - This field was created in June, 1985.
The
original grant date represents the date of the last grant issued prior
to
June, 1985, or the date of the original grant of authorization if
the
application was approved after June, 1985.

Power Output - Pertains only to type accepted equipment, and certain
notified
transmitting equipment used pursuant to a station license.

Receipt Date - Date of receipt of the application at the Mellon Bank in
Pittsburgh, Pennsylvania.

Related ID - FCC Identifier assigned to a companion application filed
simultaneously.

Rule Part - FCC Rule Part(s) under which the equipment is authorized to
operate.

MARKETING REGULATIONS FOR RADIO FREQUENCY DEVICES

A radio frequency device is defined in Section 2.801 of the Rules as any device which in its operation is capable of emitting radio frequency energy by radiation, conduction, or other means.

Section 2.803 - Equipment requiring Commission approval.

Equipment subject to Certification, Type Acceptance, Type Approval and Notification is required to be authorized by the Commission prior to marketing in the United States. Marketing means, "sell or lease, offer for dale or lease (including advertising for sale or lease) or import, ship. or distribute for the purpose of selling or leasing".

Advertising or display of a device requiring a grant, but has not been granted certification, type acceptance, type approval or notification will not be deemed to be an offer for sale, provided the advertisement contains, and the display is accompanied by a conspicuous notice as follows:

"This device has not been approved by the FCC. This device is not, and may not be offered for sale or lease, or sold or leased until the approval of the FCC has been obtained".

Any non-approved device displayed under the terms of the above provisions may not be activated or operated.

Section 2.805 - Equipment that does not require Commission approval.

Equipment which does not have to have a grant issued by the Commission, e.g.,
a device subject to verification, but must comply with specific technical standards prior to use, must not be offered for sale or lease (including advertisement for sale or lease), imported, shipped or distributed for the purpose of selling or leasing or offered for sale or lease, prior to

compliance testing to determine compliance with the administrative and technical provisions applicable to the specific class of equipment.

Extended Coverage High Frequency Transceivers

The purpose of this Public Notice is to clarify the Commission's Rules regarding equipment that is intended to operate in various radio services in the high frequency radio spectrum, including "10-Meter" Amateur Radio Service (ARS) equipment.

The Commission has noted that a number of transceivers imported as ARS equipment are also capable of transmitting and are being operated in nearby frequency bands allocated to other radio services such as the Private Land Mobile Radio Services, Maritime Services, Auxiliary Broadcast Services, International Broadcasting Services, the Citizens Band Radio Service, and the U.S. Government. Operation of this equipment causes interference to the authorized users of these frequencies. Some of these <<<<read here transceivers are capable of using output powers or emission types which are not permitted for the radio services listed above and some are capable of transmitting in the radio astronomy band where no two-way radio communication is permitted. Some

manufacturers are promoting the sale of conversion kits, or have designed their transceivers such that they can easily be modified by the users, to extend the operating frequency range into the frequency bands listed above. In addition, so called "export" radios which are deliberately designed to facilitate this capability are also being imported and marketed.

Manufacturers, importers, vendors and users of these transceivers are reminded that transmitters intended for operation on frequencies allocated to any of the FCC authorized radio services listed above, except the ARS, must be type <<<<read here
accepted by the Commission for the particular radio service(s) in which they are intended to operate prior to their importation, marketing or use. The Commission considers that the transceivers discussed above are intended to be operated on frequencies where the use of type accepted equipment is required, because of the simplicity of modifying them to extend their operating frequency range. Transmitters designed and intended for use only in the <<<<read here
ARS must comply with the applicable technical standards contained in Part 97 of the Commission's Rules but are not required to be type accepted.

It is a violation of the Commission's regulations to: (1) import or market a transmitter that is designed or intended to operate on frequencies outside of the ARS bands, if it has not been issued a grant of equipment authorization for the radio service(s) in which the transmitter is capable of operating; (2) <<<<read here
import, market or operate a transmitter that requires a grant of equipment authorization but for which no grant has been issued; or, (3) transmit on a frequency allocated to a licensed radio service without the appropriate Commission-issued station license. Violation of the Commission's regulations will subject <<<<read here
manufacturers, importers, vendors and users of this equipment to appropriate criminal penalties as provided for by federal law(s), including fines and/or imprisonment. In addition, the equipment described above can be seized by, and forfeited to, the government.

For further information concerning this Public Notice, contact Gary Hendrickson at the FCC Laboratory, 7435-A Oakland Mills Road, Columbia, Md. 21046, (301) 725-1585, Extension 223, or E-mail: ghendric@fcc.gov.
End of listing : .

I hope this helps.

Depends on the time Bill, at my place in Warren County, which I'm sure is
close to you, it is nearly impossible to find a spot on 75 meters during
the peak, early evening hours. Clear spots can be found on 160, but I don't
have the real estate for an efficient antenna...Propagation on 75 meters is
such that activity affects an area much larger than NY/NJ/PA/CT at peak
times.

What? You mean I won't be able to listen to rehashed DW, BBC, or RFI
broadcasts on CBC Overnight nor the OHL Hockey scores on CJOY with my GE
SR II, anymore. I can't hear 1900 mHz on my DX 400 nor on my R71A
either, not even on my clock radio! All I'll be left to listen to is
SRC's culturally important stuff like 11th Century recorder music
because they won't touch a Holy Cow like SRC.

Just kidding! Are you sure of your facts? I haven't read the issue of MT
so please explain what you mean by, "around 1900 MHz (I think)"? Maybe
while writing the article, the author enjoyed the loco weed he/she got
from the CRTC interviewees? (They must be on something other than
coffee. Look at the allocations in the last 10 years.)

BTW, I'm no subject. I'm a Canadian citizen, eh! :) :)
--
Regards,
Werner Funkenhauser
WHAMLOG links: http://www.inforamp.net/~funk

P.S. You should know that one of the first entries (and presumably an
application) to the Extended Band in the FCC's database was CFOS for
1610 kHz. It's still listed as of today.

Good insights but why still play the role of a victim? To be liberated
from your past, you have to LET IT GO. Ten years from now, you'll hate
who you are today. There is no peace or healing going on when you
despise anything, past, present, or future. Its all INSIDE you - what
isn't there to love?

Peace and healing come with acceptance and forgiveness. Then you can love
instead of hate. Much better use of energy. In fact, the sensation is
that it takes no energy. What we resist (the pain of not loving) persists.

73,

John/WD1V

From: Lee <rfi@voyageronline.net>
Message-ID: <01bc24d5$f9358700$1e7e80d0@default>
Source record: 203422

I've been reading a lot about the HAARP project in the alt.conspiracy newsgroup lately. Yeah, I know, that group is full of wackos, but some of the posts make sense. It makes me wonder what the true purpose of HAARP is. Is it just an ionospheric research project or is it a secret weapon? I'm not one who finds conspiracies in everything but with recent revelations about radiation testing on American citizens and the Tuskegee syphilis study, I am very skeptical of anything the government has to say. I would like to hear from the ham community on what you think about HAARP and mostly, should we support it by sending them signal reports, etc.

Looking forward to your responses,
Lee (KR4ND)

Mr Wetzel, after reading the postings of you and Tom Gasta, two bench techs who have chosen to limit your professional and educational development at fixing radios, responding to several engineers who have patiently tried to explain the FCC cert and acceptance area, I am bemused. For some reason , you have taken Mr Bauman's in depth and thoughtful posting as some how justifying your ramblings. I'm afraid you and Mr. Gasta just dont get it, but thats just plain obvious.

HEY WETZEL, IS THAT PAGER READY YET, THE CUSTOMER IS UP HERE AT THE COUNTER ?

hope that something better will spring, like the fabled phoenix, from
the ashes of the old.

4700. Replacment mic element?

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-27 00:00:00 UTC
From: adkinsg@piranha.ianet.net
Message-ID: <5f4kl1$859@piranha.ianet.net>
Source record: 203428
Cross-posted to: rec.radio.cb,rec.radio.amateur.misc,rec.radio.amateur.homebrew

Hi.

I have a TRC-484, and I've decided the mic is completly crummy. I thought about replacing it with an astatic or something, but I didn't really want to fork out that much money, since the radio was only $50 to start. Plus, the mic has channel up/down buttons on it, and the CB is mounted far enough away for this to be very helpful.

Are there any replacement mics that up/down channel selectors? I cracked open the mic, and it's a simple three wire circut. (i.e. center to left is down one channel, center to right is up one channel)

I thought about just adding some small momentary switches to a regular mic, but that becomes clumsy and looks bad.

Alternatively, I could just replace the mic element, I suppose. I looked in an "All Electronics" catalog, and they only had electret mics, and I was concerned about fitting a battery and isolation circuits in the small mic case. (RS only sells electret mic elements, too) I guess i could use one of those strange T175 7v little batteries, it might fit.

If i change the mic element to an electret, will I overdrive the input circuits on the cb? This would probably be the cheapest solution...

Thanks for any help!

Garry

Allow me to extrapolate here for a moment.....

If I read this correctly, If a transceiver is designed to be easily modified, then it must be 'type accepted' (or approved or what-ever) before it can be marketed and sold. That would lead one to believe that if buy a radio that can have its coverage extended mearly by removing a jumper for instance, then it should already be 'type accepted' for that use. Otherwise, it could not be marketed and sold.

Continuing, (and recapping,)

> It is a violation of the Commission's regulations to: (1)
>import or market a transmitter that is designed or intended to
>operate on frequencies outside of the ARS bands, if it has not
>been issued a grant of equipment authorization for the radio
>service(s) in which the transmitter is capable of operating; (2)
>import, market or operate a transmitter that requires a grant of
>equipment authorization but for which no grant has been issued;

OR,

>(3) transmit on a frequency allocated to a licensed radio
>service without the appropriate Commission-issued station
>license. Violation of the Commission's regulations will subject
>manufacturers, importers, vendors and users of this equipment to
>appropriate criminal penalties as provided for by federal law(s),
>including fines and/or imprisonment. In addition, the equipment
>described above can be seized by, and forfeited to, the
>government.

As I read this; if I have a modified transmitter, and I'm operating under a valid business license, then I'm OK because of the giant word OR between #2 and #3.

How do you interpret this?

BTW, thanks for the great post. Finally, some real information

Get your attributions right, Spew. I didn't write several of the paragraphs
you so kindly quoted me as saying.

>Unlike you, Mikey, most people realize there is no connection between the
>opinions that an individual expresses on his own time while exercising his
>right to free-speech and the employer whom the individual works for. No
>connection whatsover. Moreover, most people realize the adverse legal
>implications of harrassing an individual's employer in an attempt to have
>his employment terminated because of opinions he has expressed on his own
>which have nothing to do with his job or his employer.

Courts have long held that "public figures" (such as radio DJ's) have
a higher standard of behavior when it comes to issues like slander and
libel. There is nothing illegal or slanderous about taking your postings,
especially those in which you identify yourself as an employee of a concern,
forwarding them to your employer, and then organizing a picket of your
employer because they employ homophobes.

"Hey Hey. Ho Ho. Spew the Homophobe has to Go! [chorus]"

Not that >I< would ever condone such an action, mind you, because I've
had similar things happen to me personally -- I merely find it interesting
that a group hasn't targeted you.

A popular quote used on the ham bands when faced with malicious QRM and vocal vandals, is "don't feed the animals". With that view in mind, this will be my last post on THIS subject. I really don't expect to see any logical debate flowing from the likes of burt, who could EASILY sail around the world in his own wind powered sailboat - but regardless of my own personal failings, I have YET felt the lonliness and need to advertise on Internet in an effort to find someone who will talk to me on the radio. Party on, Burt dude....

>> For a single class of license to be workable without lowering the level
>> of qualifications dramatically, the test would be enormous.

>I'm not sure what this means? The basic premise is that you are
>qualified
>to operate an amateur radio transmitter or not.

If the single class of license were chosen at the current "full
privileges" level of Extra and the same pools were used, the single exam
for the single class license would consist of about 170 questions -
perhaps that's not too much, but it's a big chunk. Either that, or some
of the material would have to be dropped. I would interpret the latter as
a "reduction in level of qualifications". You may call it what you like.

>Shifting gears to the
>general and extra class licenses, one requires 13 WPM and 70% of 80
>questions, while the other requires 20 WPM and 70% of 170 questions.
>A rather significant difference, yet the general is allowed to
>operate with 1500 watts OOK Morse Code at 14.025 MHz but not at 14.024
>MHz.
>What sense does that make? If he's qualified to operate at 14.025 MHz,
>he's certainly qualified to operate at 14.024 MHz.

You are preaching to the choir wrt qualifications for operating a
transmitter. Not sure how any of the above is in dispute with my
observation. The only way adjusting frequency privileges by class makes
sense is that it's enforceable, and provides an incentive to upgrade.
In the abscense of those reasons, I would agree - it's totally senseless.

>Part 97.1 (which covers self improvment) is not a mandate. It is
>the basis an purpose. Making Part 97.1 a mandate and hence require
>all operators to fulfill all clauses of it would require all
>operators to be members of ARES or R.A.C.E.S. organization,
>participate regularly in DX, further the state of the art, etc.
>In fact, amateurs are free to contribute to any or all of those
>aspects of amateurs radio, and not required to perform them
>all.

Please note that my comment was that it is incumbent upon the _service_ to
promote self improvement, not any amateur in particular. Part 97
describes the responsibilities of the amateur service, as well as those of

it's licensees. Looking at it your way, yes, we can just say; "it's not my job to administer license examinations, or it's not my job to self police, it's just something I have the option to do."

>How is it more or less enforceable than the current 1500 watt
>limitation?

Both are equally unenforceable. So we should add more unenforceable rules? Perhaps, but I would like to see us have a good answer prepared for the folks at the FCC when _they_ raise the question. That's all.

>Another clear focus should be antenna restrictions, either government or
>contractual. Those more than anything else are likely to dramatically
>alter the future of the amateur radio service. HF operation may soon
>become the playground of the rural amateur and a place only dreamed
>about by the urban amateur.

Roger that. We are approaching the dire situation you describe. I hope we are approaching it asymtotically.

I imagine you could find at least one of them right here in this
newsgroup, or at least one or more of the first small group.

>imagine that the intent of the first link of the 'packet network' was
>to forward information, not garbage. Keeping the network free of
>garbage reserves valuable space for valid information to be passed.

Nonsense. One man's trash is another man's treasure. Who appointed
you arbiter of what's garbage and what's not?

>The amateur packet radio network already forwards, by design, an
>incredible amount of garbage in the form of message headers. I

At one time, those were mandatory. They still contain an amazing
amount of information essential to maintaining and troubleshooting a
network. Yes, they could be streamlined. So could a lot of other
things.

>that garbage a totally unnecessary ASCII drawing at the end of
>every message, a few lines of advertising from the guy who wrote
>the whiz bang terminal program used to generate the message, and

Yes, those are wasteful. But that's a separate issue, unless you
decide that you aren't going to forward anything by anyone who uses
ASCII in his signature.

>network does a wonderful job of diseminating garbage, but unfortunaly
>falls flat on it's face when it comes to delivering mail from one ham to
>another ham.

That's why we have the Post Office and the telephone. Of course, if
sysops were doing their job instead of worrying about censorship and
power trips, it'd work a lot better. In fact, it DID work better
several years ago than it does now.

>I agree one hundred percent with Steve. I supplied the two computers,
>three radios, three TNC's, assorted power supplies, cables, antennas,
>etc. that are used to run my packet BBS and DX cluster. I pay the

Don't teach your grandmother to suck eggs. I've done all that stuff,
and more.

>electric bill every month. When the little red transmit light on one of
>my packet radios turns on, I decided what gets transmitted, and it damn
>sure won't be Bubble Head's Bible Quotes or daily birthday lists from
>the Happy Club. Steve chooses to keep certain people off his system.
>I choose to keep certain garbage off my system. We are both doing
>what we are supposed to be doing, monitoring and eliminating garbage.

You're both part of the problem, not part of the solution. You have
no business setting yourselves up as arbiters of what's garbage and
what isn't. If everybody did that, there'd BE no packet network. If
you want a closed net, be my guest. Forward to *each other*, sans
"garbage." But don't pretend to be part of an open, global BBS
network, because that is NOT in the spirit of Amateur Radio.

>My packet equipment isn't a 'public service'. It's a service provided for
>hams to use in relation to ham radio. Bible banging and birthday lists

No, it's an ego trip that allows you to force your decisions of what's
"right" or "wrong" on your fellow hams.

>have nothing to do with ham radio, so I make the decision to keep that
>junk off my system, and not contribute to the confusion by sending it
>to other systems.

You're a disgrace to good sysops everywhere.

>When you, TAPR, or the ARRL decide you would like to reimburse me for
>the cost of my equipment and start sending me a paycheck, I will be
>happy to revert to your system of not excluding anything from my BBS.

When folks like Burt get their way, thanks in large part to attitudes
like yours, I hope you'll be very happy with your commercial station.
Of course, if you had to compete with commercial stations, you'd be
out of business in a week, since the real world has little tolerance
for censorship and ego trips.

>

One I'm talking about people that don't have a Hearing or other problem. If you have a hearing problem you can get a doctors note and not have to take the tone test but a light test instead. So that not a good WHY to drop the code for all just becouse you can't hear good. Not ALL people have a hearing problems like you. Now you can take a light test instead or have the Test droped if you have a hearing problem is UNDERSTANDABLE.

BUT TO DROP THE CODE TESTING FOR ALL just BECOUSE SOME CAN'T HEAR GOOD IS NOT A GOOD REASON!!!!!!!!!!!!!!!

Frist of all, this is a Radio Hobby. CW is a part of that hobby just as is SSTV, ATV, PACKET, SAT, ect. I believe that if you want to be part of that hobby you should have a understanding of ALL FORM's of that hobby. Or what's the point in joining it in the frist place? CW is not the problem. People are! People think this is a RIGHT, but it's not. IT'S A HOBBY!! join like stamp's, coin's, ect. CW is a PART of the WHOLE hobby! If you don't like something then you don't join. That's very simple. just When you went to school did you care for all the subject you took? Should we drop the one's you don't like just to make you happy? NO! So there's the whole point! CW is part of the hobby! See I'm a Amateur Radio person and injoy it very much. Just becouse I don't like DXing, should I have it removed? NO! It's a part of the hobby! I like VHF and UHF to talk local is fine to me. For I'm a NO-CODE TECHNICIAN and that all I want from the hobby! Some like DXing well then to be part of that you should know more about the hobby! RIGHT? CW is fun if you like it. I know lot's of people that all thay do is CW. you will never hear them on VOICE. then some just do voice. but it's ALL part of the WHOLE!

There are comments directed towards me that EVERYBODY thinks the way most of you think. Here is a typical comment I receive IN SUPPORT of my position.

From: PTracy@aol.com
To: k1oik@rocketmail.com
Subject: It works, and glad it does.

Burt, I do hope you are the same Burt I used to exchange messages with about
a year or more ago on the RIME network. Lucky for you, I'm not going to kiss
you, but I do miss your posts. There are no BBS's in the Hartford CT area
that carry the RIME network anymore.

I think I lost RIME access just before the last Boxborough, MA ham extravaganza. Boxborough, where we (and I do mean we, not the HAM we which means I or me) get to watch a bunch of geeky, foul smelling, unkempt misfits with their pants halfway down thier asses weighed down from too many handhelds with oversized battery packs, passing gas with every step and belching while aimlessly wandering through the flea market in what can only be described as a drug or booze induced stupor. Where else can one find so much entertainment for so little money?

Anyway, RIME or not, I am indeed happy to see your name and taglines again. Nice to know you are still around. My only other hope is that you don't think of me (or would that be 'us' on the radio) as the typical, boring ham. That's not me. Really. TTYL Burt.

> your XYL, who is still 130lb, tremendously attractive, comes to
> you in a hot pink, topless teddy and starts nibbling on your shoulder

The frequency range for DRB in Canada will be 1452-1492 MHz. Here's
a copy of the notice from the Canada Gazette:

GOVERNMENT NOTICES

DEPARTMENT OF INDUSTRY

RADIOCOMMUNICATION ACT

Notice No. SMBR - 005 - 95

System Standard for Digital Radio Broadcasting (DRB) in Canada

On August 5, 1995, Industry Canada issued gazette notice SMBR-003-95
proposing the adoption of the EUREKA-147 (DAB) system as the Canadian
system standard for Digital Radio Broadcasting (DRB) services in the
frequency band 1452-1492 MHz. The Department invited the public to
comment on the proposal within 60 days from the date of publication of
the above notice.

The Department received submissions from the Canadian Association of
Broadcasters (CAB), the Radio Advisory Board of Canada (RABC) and the
Canadian Broadcasting Corporation (CBC). All comments supported the
adoption of the proposed DRB system noting that the broadcasting
industry needed a system standard that would provide significant
improvement in sound quality, service reliability and data capacity
over present analog transmission systems.

In view of the above, Industry Canada hereby announces the adoption of
the EUREKA-147 (DAB) as the Canadian system standard for DRB services
in the frequency band 1452-1492 MHz.

Copies of the document containing the essential characteristics of
this system standard known as "Digital System A" may be obtained from:
Industry Canada, Publishing Services Centre, 300 Slater Street,
Ottawa, Ontario, K1A 0C8, or from regional offices in Vancouver,

Winnipeg, Toronto, Montreal and Moncton.

Dated at Ottawa this 15th day of November 95.

G.R. Begley
Director General
Spectrum Engineering

>
> 73,
> Carl - wa6vse
> carl@ais.net

Carl,

To be a heretic, you have to preach against the orthodoxy and I am not sure what the orthodoxy is in this case.
It could be the CW requirement, but that decision has already been made. Entry into Amateur Radio is possible without taking a CW test. It could be the HF for General and above forever feeling, but that has also been settled with Novice and Tech Plus haveing HF phone privileges in addition

to their CW HF privileges.
It may be the feeling that for some reason you have to show more technical expertise to operate in the HF region than in the VHF region. That has been settled also.... How much more technical expertise does it take for a General or higher class operator to fire up a medium power transceiver on 75 or 40 ssb than it does a Novice or Tech Plus to fire one up on 10 meter ssb?.

All of these questions have been asked and answered. I could take a real heretical approach and make a case
that it really takes more technical expertise to operate with full privileges on VHF than it does on HF. In many cases, VHF TVI, RFI, BCI, Baby Monitor FI and other FIs can be a bigger problem on VHF than on HF. Antennas for any kind of long range work are more critical. Communications modes such as the various forms of scatter require better operating technique knowledge than typical ionospheric propogation in the HF range. The care and feeding of high power amplifiers at VHF and UHF require more attention than at HF.

Maybe we have been doing this all wrong.... maybe you should have to have an advanced form of license to operate in the VHF region..... hi.

4715. Help wanted - Russian time & frequency standard

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-27 00:00:00 UTC
From: Robin Barlow <robin.barlow@zetnet.co.uk>
Message-ID: <19970227230622688838@zetnet.co.uk>
Source record: 203443

I'm unable to find out accuracy information re: the above standard
transmitted on 4.996, 9.196 & 14.996mhz - call sign RWM

Does anyone have any information on the above, including accuracy
information - is there a more relevent newsgroup for this post ?

Thanks

You are both right & both wrong. Code is cool for experimentation, your first rig being CW has a nice price tag to it! Hanging on to CW after that you have to question what the HAM operator has done technically lately, Talk about a Glorified Appliance Operator! High speed code belongs to a machine, anything else may be cool to be able to do, but also quite pointless in todays world.

I wish the FCC would get rid of the silly logging requirement for different new modes of modulation. There probably should be a standard way of ID'ing stations involved however.

Even more thoughts

No, no, no, no. That's not correct. I've made a mistake, and I am man enough to admit it. I ASSumed Drew was a nocoder without checking the facts. On this point, and only this point, I concede. Although, it was a very small point, and as usual, Spoo ignored the gist of what was said. He's not a big challenge, kind of pathetic actually. But please don't say someone who's passed the 5 WPM test hasn't accomplished anything, they've accomplished a GREAT deal.

The comparisons were with the "slow" CLOVER controller (P-38) instead
of the "fast" controller (PCI-4000 or DSP-4100). With the "slow"
controller,
the top CLOVER data rate is limited to 1/2 of that obtainable with the
"fast" controllers. All tests I've seen to date give PACTOR-II an edge
under poor S/N and under rapidly changing conditions, and give CLOVER
the
edge under good conditions. Other than at these extremes, the two
protocols
perform very similarly.

Hardly true at all yet. Most of those systems are still on CLOVER.
The cost of the PACTOR-II controller, compared to only moderate
improvement
in overall data rate in realistic forwarding situations has convinced
many
of us not to bother making the investment. Perhaps when the cost of the
PACTOR-II controller drops a bit ...

The use of data compression benefits both protocols equally, and in
exactly the same manner. Having compression "built into the controller"
can be a big lose, since the application might well choose a more
powerful
compression scheme. So to make reasonable comparisons between the two
controllers (PACTOR-II and CLOVER) you need to compare ONLY the raw data
rates, under similar conditions. This is the comparison which shows
PACTOR-II
better in low S/N situations, and CLOVER better in high S/N situations.

Note that the majority of BBS forwarding is done in high S/N situations;
at the small data rates available from either controller under low S/N,
it is not possible to move enough data to be "interesting."

> six different on-line compression methods in addition to the run-length
> encoding, and automatically applies the most effective one.

The advantage of "not offering" the feature is obvious: the application
has the choice of using whatever compression scheme it wishes, and it
not
limited to what is hard-wired into the controller. In the case of BBS
forwarding, it is ONLY the stations running WinLink which do not use
compression.

> already
> breaks if the SNR falls behind minus 5 dB.

This is the situation where PACTOR-II performs better than CLOVER.
At the other end of the S/N chart, CLOVER will outperform PACTOR-II
by somewhere between 10% and 50% or more. The data published to date
is unclear on the margin, and was obtained using the P-38 controller
(which is limited to 50% of the maximum CLOVER data rate.)

It would be very nice to see some results from better controlled tests,
covering the full span of capability of both controllers.

The other important issue which has not been addressed in any report
I have seen is the performance of either controller under different
types of propagation. PACTOR-II should adapt more rapidly to changing
conditions, and should have an edge over CLOVER at any signalling rate
under these conditions. The region of interest here is propagation
which varies on a few second to several tens of seconds span. Very
common situation for paths with multiple ionospheric modes.

Both SCS and HAL claimed a 4 kHz noise bandwidth for the tests which
measured data rate vs. S/N. In my mind this is equally misleading on
both sides ...

I won't comment on the matter of "who is right" and "who is wrong".

No matter which company has behaved better or worse, we simply do not
have enough information to know which controller will work better under
what circumstances. The solution to this "problem" is simple I guess:
purchase both controllers and do the experiments ourselves.

Well DXing is O.K. for some but not ALL! Local chating is COOL! I know KD4OBQ. I seen him at the hamfest in Orlando. :) I talk to Orlando sometime. But I just play Computer's, VHF, and UHF. I can copy Code to. I do it down at MOSI in Tampa. I just don't want my hobby to go the DOG's! I see people all the time say that CW is keeping them from Amateur Radio.

RIGHT, what it realy is thay want to CB on here. :(14.313... It's not code. I learned code long ago when I had to back in the 60's. It's just thay don't want to learn it. Just like in school some subject people did badly in. did the school drop the subject just becouse you did not like it or think it was needed? NO! that's all it is with CW. This is part of the Hobby or Service of Amateur Radio and should stay a part. just like all the other item's are on the test that some don't use. :) RIGHT!

4721. FT-50 question SMA=BNC?

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-27 00:00:00 UTC
From: Phillip Nichols <maccabeus@gatecom.com>
Message-ID: <33163D5F.71E6@gatecom.com>
Source record: 203449

-- the following was faxed to yaesu with no reply... HELP?
==========
Email: maccabeus@gatecom.com
WWW: http://www.gatecom.com/~maccabeus
Packet: kc8dqf@kb8rmx#semi.mi.usa.noam

==========
I am looking for a general coverage reciever that also transmits
on FM Ham frequencies. The FT-50 seems to be the only option.
It appears to be a nice rig except for 1 thing. An SMA Antenna
connector rather than a standard BNC. I can't imagine why? It
excludes so many. You offer an SMA=BNC adapter. when threaded
into the FT-50 how far out of the unit does it protrude? How far
out does it extend the antenna? Not far I hope; I would like to
think that in the name of satisfaction that the adapter is designed
so that the added antennas still rest snug against the FT-50 housing.

Is an SMA similar to the style used by MFJ for its mini-mag 1/4wave
2 meter antenna? the bottom 3/8" are threaded at a 3/8" diameter.

It is my hope that if I purchase the FT-51 with the adapter that I
will still be able to use my Comet 32 1" mini atenna without it
protruding 2" from an HT that is designed to be compact to begin with.
I dont understand why the OEM antenna is longer than the HT even.

thanks

4722. Wisconsin QSO Party

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-27 00:00:00 UTC
From: wa9pov@earth.execpc.com
Message-ID: <5f5gk2$3rn$1@earth.execpc.com>
Source record: 203450

1997 WISCONSIN QSO PARTY RULES

DATE/TIME: 1800Z MARCH 9 - 0100Z MARCH 10, 1997

MODES: CW and Phone. All stations may be worked once per mode on
each band. In addition, mobiles may be worked once per mode
per Wisconsin county that they operate from. No Repeater QSOs.

ENTRY CLASSES

Single Operator Fixed Multi Operator Fixed Multi Xmtr/Multi Op Fixed
Single Operator Mobile Multi Operator Mobile Multi Xmtr/Multi Op Mobile
Single Operator Novice Multi Operator Novice Multi Xmtr/Multi Op Novice
Single Operator Tech Multi Operator Tech Multi Xmtr/Multi Op Tech

EXCHANGE: Wisconsin stations send county.
Non-Wisconsin stations send state or province or country.

SUGGESTED FREQUENCIES

CW: 3550, 3705, 7050, 7125, 14050, 15M CW, 10M CW, 6M CW, 2M CW
Phone: 3890, 7230, 14290, 21350, 28400, 6M SSB & FM, 2M SSB & FM
Other frequencies may be used

SCORING

Phone contacts count 1 QSO Point; CW contacts count 2 QSO Points.
WISCONSIN STATIONS: Multiply the sum of QSO points by the sum of Wisconsin
counties (max. 72), plus states (max. 50) plus Canadian provinces (max. 13)
worked. Note: DX countries worked count for QSO points but not as multipliers.
NON-WISCONSIN STATIONS: Multiply the sum of QSO points by the number of
Wisconsin counties worked (max.72).

BONUS: WISCONSIN MOBILES/PORTABLES: Add 500 bonus points for each county
that you operate from, outside your home county, with a minimum of 15
QSOs per county to qualify.

LOGS: Entries must contain a log consisting of: Time (GMT), call, band,
state/province, Wisconsin county, mode and a complete Score Summary
including YOUR name, address and call. Circle new multipliers as
worked. Logs containing more than 200 QSOs must be accompanied by a
dupe sheet (separate dupe sheet for each mode). Mobile entries must
indicate county changes in log. Postmark by March 31, 1997.

Send to: WISCONSIN QSO PARTY
WEST ALLIS RADIO AMATEUR CLUB
P. O. BOX 1072
MILWAUKEE, WI 53201

Complete rules, entry form and Wisconsin counties list is available at:

Al,

I asked the same question a while back on the Netscape Newsgroup.
Unfortunately, the answer was that it won't be implemented until version
4. BTW, I got a very quick response on that newsgroup, though it's very
busy (hundreds of new messages every day.)

O. I C. The packet 'network' isn't for forwarding mail from one ham to another.
It's a digital soapbox for Bible Bangers and Birthday Clubs. Thanks for letting
me in on that secret. Next time I see someone put NTS traffic or a personal
message on the BBS here, I'll kill it and tell them to use the telephone.

You appear to be of the 'forward it anywhere and my job is done' mentality.
No wonder you'd rather forward bulletins than personal mail. ANYPLACE
is the right place to forward a bulletin. Personal mail requires a bit of
work .....

>Don't teach your grandmother to suck eggs. I've done all that stuff,
>and more.

Well, since you have already taught your grandmother to suck eggs,
I guess we can have her teach mine, but if you want your grandmother
to teach my grandmother to do anything, tell her to bring a shovel, cuz
she's gonna have to dig my grandmother up before she can start class.

>You're both part of the problem, not part of the solution. You have
>no business setting yourselves up as arbiters of what's garbage and
>what isn't. If everybody did that, there'd BE no packet network. If
>you want a closed net, be my guest. Forward to *each other*, sans
>"garbage." But don't pretend to be part of an open, global BBS
>network, because that is NOT in the spirit of Amateur Radio.

There is no such thing as a global Amateur Radio BBS network. There
never has been, and there never will be. Unless, perhaps, if you define
'global' as a hundred miles in any direction of your house. Most of us
who don't live in the United States Of Drug Dealers use the word
'global' to mean the ENTIRE world, not just the little part that you live
in. If you have fooled yourself into thinking there is a 'global' packet
network, send me a packet message with your phone number in it and I'll call you
when it gets here: KH2D@KH2D.GUAM.USA.OC

Don't bother staying up late waiting for me to call.....

>>My packet equipment isn't a 'public service'. It's a service provided for
>>hams to use in relation to ham radio.

>No, it's an ego trip that allows you to force your decisions of what's
>"right" or "wrong" on your fellow hams.

Now I'm on an ego trip. OK. Didn't you just tell me "Don't teach your
grandmother to suck eggs. I've done all that stuff, and more. "

>When folks like Burt get their way, thanks in large part to attitudes
>like yours, I hope you'll be very happy with your commercial station.
>Of course, if you had to compete with commercial stations, you'd be
>out of business in a week, since the real world has little tolerance
>for censorship and ego trips.

You lost me a bit here, I'm not sure what 'Burt's Way' is, I thought this
discussion originated because you were upset with the fact that Burt's
mail was being kept off Steve's system. I'm not here to compete with
commercial stations. I'm here to enjoy ham radio. But you're right.
Nobody gets fired when the operator of an Amatuer Packet Radio BBS
runs around patting himself on the back yelling 'I'm a SYSOP ! I'm a SYSOP !"

while the mail is getting forwarded to La La Land. And judging from
the amount of mail that goes to La La Land, it's a good thing, because
a lot of 'sysops' would be out of a job.

I think we have found the problem here, Glen. You don't seem to have
a firm grasp of the definition of the word 'network'. Networks don't
collapse from lack of traffic, they just move the existing traffic much
faster.

Well, Bobby, after that little tirade I think you have convinced us all that you have found a home: The Magic Of Amatuer Radio Telnet BBS. Sounds like a great place. Like Fred's Fish Market and Shoe Repair Store.

Please don't upgrade, we wouldn't want you to subject yourself to the trash on 20 meters. Stay here on the internet. This trash is a lot cheaper than an HF rig anyway, you're right.

>classes. This is what seems to be causing the perceived split of the
>amateur community.

I would like to comment on this one particular thought. Last night I was pondering something. I was wondering if the no code tech license has really brought in large numbers of people that otherwise would not be in the service, or if it has stagnated large numbers of people that would have advanced to higher class licenses had the no code tech license not been available.

In the twenty plus years I have been a ham, I seem to have noticed two things about all the 'new' people who enter the hobby. One, nobody 'likes' learning Morse code, and two everybody can't wait to pick up a microphone and talk. The desire to do number two always seemed to be the driving factor for number one. There have always been hams who have made it to the VHF repeaters and stopped, but has the no code tech license caused a chronic

stoppage at this stage of the hobby ?

Everywhere I go, Usenet, the WWW, ham radio newsletters, QST, I see a lot of writing about how much trouble ham radio is in. Which makes me wonder again. Is ham radio really in as much trouble as some people think it is ? One thing that bothers me is everyone seems to have the reasons for all of ham radio's problems: the internet is more 'romantic', housing covenants in the United States make it 'virtually impossible' to find anywhere to live where HF antennas are allowed, Morse code testing is killing the hobby, the ARRL is killing the hobby, commercial interests want all our spectrum, etc. Is ham radio really in as much trouble as we read it is, or has our newfound toy of instant personal communications for the masses just provided a soap box with a much larger audience than was previously available ?

Everyone seems to be aware of the 'problems'. Nobody seems to have any intelligent solutions. Take the 'internet problem', for example. Obviously, many more young people are presented with the internet than are presented with ham radio. The world wide web with it's graphics and point and click nature is obviously much more appealing than a text based packet BBS. The 'solution' we are presented with by the techies is to a) kill the code and b) invent more hitech modes for ham radio, upgrade our 'packet network' to gigabaud rates, use spread spectrum technologies......

I run a packet BBS/DX cluster here in Guam. I use two computers, an HF radio for a link to Japan, a VHF radio for local users, a UHF radio for a 9600 baud forwarding link to another BBS on the north end of the island, three TNC's three antennas, a modem for a wormhole internet link to the U.S., etc... Six or eight thousand dollars worth of equipment, and I can send a packet message off to someone on the other side of the world and MAYBE he will get it in a week or so, and MAYBE I will get an answer back..... I don't do it because it's fast or efficient, I do it because I enjoy doing it.

From a marketing standpoint, which is your business, how do we convince someone to join us on packet when they can do everything we are doing, much much faster, and much more reliably, with a $19.95 a month internet account and the personal computer they already have ? What spread spectrum, gigabuad rate hitech ham radio invention can we put together and make available to the masses that will be available for less than $19.95 a month that will make everyone drop the internet like a hot rock and flock to ham radio ? I doubt there is one, and I doubt there ever will be one.

I don't see the internet as a problem to ham radio. I see it as an addition, with many benefits. Instant access to QSL information, interesting information (plus pictures !!) of DXpeditions, instant access to software tools to enhance the enjoyment of ham radio, instant contacts with hams all over the world who share common interests. I use to sit and chat with local hams as we scanned the HF bands looking for DX - now I sit and chat with hams all over the world as we scan the HF bands.....

Since you are in marketing, you probably won't agree, but I never have looked at ham radio as something that could be 'marketed'. I don't think, in todays world, that anything can be done to make ham radio the communications medium for

the masses. What attracted me to ham radio was an interest in electronics and a fascination with the 'magic' of radio. I really doubt that the endless ideas for tinkering with the licensing structure will generate any interest or fascination. Obviously, lowering the 'cost' of a ham license will bring more people into the hobby. But will people with no interest and a lack of fascination be good for the hobby, or will they evolve into the group of inactive lower license class hams we see mentioned so frequently ? Or will they evolve into the group of hams who quickly become bored with ham radio, due to the fact that they entered the hobby with no real interest, and in their discontent and bitterness will they do everything they can to disrupt the hobby and make it look bad, as some of our regular posters here do on a daily basis ?

I don't know what the solutions to all ham radios problems are, George. I am not really sure that I am convinced that ham radio has as many problems as some people would lead us to believe. If it really isn't broke, should we fix it ? But I am sure of one thing. Nothing lasts forever. Maybe in todays world of high speed digtial satellite communications, celluar phones, and the internet, it is time for ham radio to die. If the time is here, should we stick a bunch of tubes in it, give it a transfusion, change a bunch of things to make it last a few more years when the end is inevitable anyway ? Or should we resign ourselves to the fact that the time is here and let it die a peaceful, natural death ? I guess the only one who really has the answers is Father Time......

(I'm always suspicious of flames such as above when the author fails
to include any of the remarks he's disagreeing with. It usually
indicates he has no defense, so instead he insults.) What portion of
Dana's statement do you take issue with, Bill? As I recall, Dana's
concern with taking an amateur radio and using it out-of-band was
in regard to the freq'y agility of such radios. It's a very valid
concern.

I've already pointed out why someone shouldn't use an amateur HT
for fire service communications; its freq'y agility and non-resistance
to the heat of fire were two main points that caused me concern
(I had a portion of my helmet melt in one structure fire - can't
imagine any amateur HT being able to survive such heat, but commer-
cial radios *will* be able to withstand such temperatures).

Let's supposed someone wants to use their 2m HT in the marine band.
Most boaters know that they can contact the Coast Guard on ch. 16.
But what's a channel designation mean to someone whose HT only
reads the freq'y of operation? Suppose you have an emergency and
the USCG tells you to shift to channel 22A? Or channel 12? Those
designations are useless to someone who doesn't have a channel-to-
frequency chart in their hand. Bridge-to-bridge comms are supposed
to be done on channel 13. What freq'y are you going to set your HT
to? The marine operator just asked you to shift to channel 83 for
a phone call. What freq'y is that, Bill? Are you going to commit
to memory all 80+ or so frequencies/channel numbers?

You're sore because we've presented some valid reasons (aside from
the legal issue) for not using an amateur radio for out-of-band
service. Don't be sore - just open your wallet and *buy* the proper
radio for your needs.

Jeff KH2PZ (former fireman *and* former Coast Guard radio officer)

Hi RJH - Don't be too hard on old Spew. While working at Coast Guard Monterey monitoring 2182 kHz (and a dozen other frequencies) I'd nightly have to listen to the drunk Mexican fishing boat crews sing to each other on 2182 (the international SSB distress and calling freq'y). After their voices gave out they'd play with their radio's Auto Alarm signal causing teletypes to come alive up and down the West and Gulf Coasts. Quite a large number of boats in their fleet would wreck havic nightly on this distress frequency. These folks have no knowledge/respect for international communication laws.

Quick Drew! Your boat's on fire, and the USCG just asked you to
shift to channel 22A to contact the rescue chopper. What freq'y
are you going to set your HT to? (Note that your channel-to-freq'y
chart burnt up in the fire...).

Oh no! The marine operator is asking you to shift to channel 83
for an emergency phone call from home! Quick - what freq'y is that,
Drew? (Note that you never replaced the channel-to-freq'y chart that
burned up in your last boat; and you never to bothered to memorize
all 90+ marine channel frequencies ya lazy bum.)

>I wonder how many of these "holier than thou" types ever use their
>10-meter mobiles on the CB band. Quite a few, I would guess.

Never gave it a thought - I've never had a desire to operate on 11m
due to the fact that I've got access to 160, 80, 40, 30, 20, 17, 15,
12, and 10 meters (plus V/UHF).

>-Drew in Sunny Central Florida-
> CB Radio KADF-6895 since September, 1976

Looks as if 11m is your HF band of choice, huh? At least you don't
need to pass a code test to operate there. Don't forget that 1750m
is also available to you.

: I guarentee you that if the CW requirement were eliminated for HF
: access, and everything else remained the same, that the SSB portions
: of the bands would be flooded with people who get 'instant upgrades'
: by memorizing the question pools.

By all means keep the CW requirement on HF. There needs to be some
restrictions there.

: The original poster was correct. CW is a challenge to most people.
: Most people do not want to exert the effort to rise to the challenge.
: The Japanese were dead on when they referred to Americans as 'lazy'.
: Our budding welfare-state mentality, the huge influx of 'get rich overnite'
: claims on the 'net, and the sharp rise in personal injury lawsuits all
: show that Americans want everything for nothing.

Hey.... no arguments there

: BTW: What 'new technology' are CBers using these days?

That is not the fault of those utilizing the CB service. That is the
fault of the FCC not authorizing more modern modes of communication. But
then, with 80%+ of CB operators behaving badly, I really don't see the CB
community "deserving" of any new priveleges.

Once again this total schmeg completely ignores the gist of what I said to satisfy it's own selfish adjenda. A whole paragraph, and it zeros in on one little insignifigant line that I threw in at the end. Funny thing is, the intent was to say "Sure, I do 25 WPM, but even so, the code/nocode issue is unimportant to me, and I don't comcider CW a measure of one's worth as a ham". But this mindf**k, with it's cerebral tunnelvision, just sees what it wants to. Congratulations, Spoo, you're EXACTLY like the "OLD FAHRTZ" you claim to be against. Meet the New Boss, Same as the Old Boss. When I was active 5 years ago, I did MY part on the Nocode liscense, when I got my club to send it's support to the FCC on the new license. Most of the nocoders are good operators, lids like you are the unfortunate biproduct.

The whole code/nocode thing is pretty putrid, I think. Why don't both sides get together in a big stadium and settle it once and for all. Here's what you do: Procoders on one side, nocoders on the other. We fill the stadium with gas up to the armpits of the combatants, and the winner is decided by which side can throw the most lit matches at the other. The winner, of course, will be the hobby.

> a real hassle.

We all have to face the fact that the ARRL is the enemy, not
our ally ... we're going to have to bring about meaningful change
in spite of their interference and opposition, not with their aid.

I think it's important that everyone who feels strongly this way
discontinue their subscriptions to QST ("membership" according
to the ARRL, but we know better ...) at the next renewal
opportunity to deny them the use of our funds to lobby against us.

Another organization *will* spring up to take the ARRL's place.
I strongly believe that the sooner the ARRL dies, the sooner
the future survival of ham radio can truly be secured.

Hi Jay - there ARE some rotten eggs out there, but I can tell you I have found HAMS to be some of the kindest, friendliest and most-helpful people I have ever known. I say this after taking the time - 32 years exactly since I met my first ham!

Jay123a <jay123a@ptw.com> whistled a happy tune like:

|>Hello Bill: Oh I am sure being lazy is part of it. But a majority of
|>the people are turned off by the ham radio snotty attitude. Why is it
|>that we CB'ers arn't welcomed and assisted into the ham radio fraturnity
|>with open arms.

1) You can't spell.

2) You talk strangely, with old bad habits still in evidence in many cases, like using a form of Ebonics, such as saying things like "The personal here be ...." or "Seventy-thirds" etc.

Is it REALLY that hams are "snotty" to CBers? Or is it that they just want them to make the full transition to amateur radio and stop behaving like CB operators once they get on the amateur bands? I think that is all most of us want, and I have welcomed gladly many a "good CBer" to the amateur ranks over the past 20-25 years. I can see why some hams resent CBers though if they have had bad experiences with them.

|>Maybe just human nature here. But I really think ham
|>radio has lost it's appeal to the majority of people.

Fine, then klet them go find another hobby!

|>I for one have
|>been studing the morse code, one and off for more than 25 years. And
|>still haven't passed the 5 wpm morse code test.

ROTFLVVL! You must have studied it more OFF than ON!

I looked into a couple of times when I was in the Scouts and figured I would never get it. THEN I started TRYING HARD! I made the EFFORT to learn it! I got tapes. I got records. I went to CLASSES put on by a local ham club. I borrowed an audio tone beeper and a key and started practicing sending. EVERY opportunity I had to work on it, I made the effort. I must say that I WAS encouraged by some others who were learning too, and it helps to have other friends that are into learning it with you....

|>I get a real charge out
|>of copying a few words and numbers.

Yes, that was how I started out!

|>You are confusing being a radio operator to a bunch of people who want
|>to have a good time.

Good point there. The two are definately NOT the same. It takes dedication
and work to become a ham.

|>A lot of common people want a radio service that they can talk with one
|>another without all the stuffy stuff. The locals here go bowling and
|>have a few beers, and whisle at pretty girls. Never seen any hams do
|>this.

Ha ha ha ha ha! Watch out - there are PLENTY who live that way!
I have whistled at plenty of girls and downed a few beers in my life I can
tell you!

While I can appreciate your desire to share a good thing with the transcript
of the traffic jam conversations on Channel 12 here, I don't think most hams
are going to rush out and buy a CB so they can join in!

Sorry that the hams in your area are snooty to each other on 2 meter FM.

I prefer HF bands myself, but I can tell you the hams on 2 M are VERY
friendly if you are in the right areas, like Kentucky, Tennessee etc.
especially the rural areas. I like those guys. In the urban areas they tend
to be VERY clique-ish!

I hope you are able to learn CW and join us on the HF bands where friendly
hams still help each other most places!

All the best - Bry

T.L.Bryant <tbryant@cannet.com> wrote:

: A "freebander" a pirate station that carries on 2-way communicaitons with other
: such stations outside of the ham and CB bands. They're found between 11 and 10
: meters, from 27.405 to 28.000 Mhz. 7.415 Mhz was a popular hangout for
: freebanders a few years ago, as well as shortwave pirate broadcast stations. I
: believe the term comes from the fact that they operate in free portions of the
: spectrum that aren't occupied/allocated by any legal station or service.

Freebanders do not operate on 7.415, those are pirate broadcasters
who also appear on 6.955 and other frequencies outside of the
Region 2 amateur radio band. Freebanders do operate in spectrum
that is allocated to other services, primarily just above and below
the CB frequencies.

The park service here cannot use their handheld radios on the upper part
of 27 MHz during times of sunspot activity due to the interference from
freebanders. A few years back, the US Coast Guard suffered interference
from freebanders on 26.010 MHz during a rescue operation.

Exactly right. The ARRL does not get a dime of my money because they do
not represent my interests. As their core membership literally dies off,
they will be looking desperately to replace those dues dollars in the
years to come. Only if we vote with our wallets (deny funding now) will
we be able to bring the ARRL around to our way of thinking in the future.

All signs now point towards the ITU abandoning the international Morse
requirement in 1999. At that point, if YE OLDE FAHRTZ suceed in keeping
us in the stone-age here in the U.S., it will be "the government" who will
be requiring us and thus required to show compelling interest to do so.

I am still having difficulty with my pager project. If anyone has
a solution please post or E-Mail me. I need to be able to bypass the
squelch on some old Motorola pageboy II and III's. It was difficult enough
obtaining these used pagers set for our freq., but I have been unable to
bypass the permacode analog tone squelch. I would like to be able to use
these pagers as recievers. Getting desperate, please help!!!

I wonder if anyone know about the VFO tension adjustment for Kenwood TS-870s. I can't seem to find any indication of tension adjustment in the user manual. Kenwood support doesn't know either.
Seems strange that the TS-870s doesn't offer a tension adjustment for the VFO, if this is the case. All other Kenwood gears do offer this feature to my knowledge.
Thanks for any informations.
73,
Duke

Greetings:
Well, I thought I could stay out of it, but unfortunately, things seem to be deteriorating in this discussion. While I doubt I can change what seems to be happening, I will comment on it.

1. Having been involved both in Citizens Band and Amateur Radio, I would have to say that both sides have a point. CB is more informal and I spent many a night on SSB with friends chewing the rag. It also seems to have more than it's share of "potty mouths" who resort to four letter words rather quickly. With that said...there are many good people there and many friends I will enjoy for years to come. It is not reasonable to assume laziness as the reason that people use this mode over any other.

2. Ham operators have no corner on class. Just listen in to the frequency wars on 20 meters or 80 meters. In regards to CW... it is an outdated mode of communication that seems to be held up as the "screening tool" to keep people who have a "casual interest" in amateur radio off of the HF bands. It is ridiculous to assume that ones ability or even motivation to learn CW is an accurate predictor of either character or the willingness to conduct oneself as a courteous radio operator. It's a moot issue: CW requirement is there...and if you want HF privileges, you have to learn it...but don't delude yourself into thinking it will somehow improve the quality of the operators on the air because there is little or no demonstratable correlation.

>conditions are crowded (for ex during ssb contests) some operators
>ignore the voluntary band plans and trash the 'CW subbands'.

Most countries don't have sub bands for the different classes of licenses
but rather limitations on power levels. The higher the license, the
higher power you're allowed. I like that system better since it allows
everyone to communicate with everyone else.

Strange, this works quit well in many countries. In Finland the Basic
license is limited to 120 W on HF, while the General is limited to 600
W (increasing to 1000 W) on HF and all the other conditions (frequency
range, modulation methods, bandwidths etc.) are identical on 80, 40,
15 and 10 m bands. I haven't heard of any significant problems. Over
here, the station can only be inspected by an inspector appointed by
the telecom authority.

>

>

It is easier to enforce the frequency rule only if you are operating under your own call sign. If you are not operating under your own call sign (in a non-phone mode) or use too much power, this can only be reliably verified by monitoring quite close to the transmitter. IMO, enforceability is not any larger problem with power limits as with frequency limits.

The telecommunication climate has changed a lot in the recent years and in many countries the telecommunication authorities are more liberal than the national ham radio organizations. In such an environment it is a good idea to try to affect both the national ham radio organization and the telecom authorities, particularly if the ham radio organization only represents a small part of the hams in the country.

Hams are so brave with insults, from a distance.
I receive many packet messages of support, would you like to see some?
I figured hams could not think fast enough to engage me in a live
discussion,
so far after years on here I have been unable to get on on the air with
one to do so.

I will easily win any discussion because I have the facts and I engage
students saily, they are far more challenging than most any ham could
be.

>HAM RADIO was going to the CB'ers till I tuned into 14.313. I SEE CODE
>STOP THEM.

Like that old Nintendo commercial sez: do the math.

How many people do you hear on 14.313? Maybe a dozen. Let's say 50
just to be gracious, and let's assume everyone you hear really has
an amateur license. Do The Math:

50 / 700,000 = ? % 7.14E-5

So, lets see. If I remember my exponentiation correctly, that's
.0000714, or .00714 percent of the total ham population (could have
missed a decimal there, it is 4am after all...)

Thus, the question becomes: is .00714% considered 'going to the CBers'?

You'd have a tough time convincing me.

OK, you bastards...!!!! One of my little Golden Screwdriver Rump Rangers went up the hill and broke the damn 147.435 box again..$%^&*() well, i aint putting it back on the hill and its for sale, AGAIN...

So that means the 15 or 20 sumbag losers that still use that piece of shit will be polluting a 2 meter box in your area (Southern Calif.) Yup, they be out there cussing and jamming and causing trouble....Of course some drunken moron like Harold, KK6OI will probably put a box at his house so he can lay on the sofa and smoke dope all day while he listens to the unemployed perverts jam each other..

well, screw you people...you desrve it and I've pretty muched ruined the 'peter anyway. I think I'll go order up some new club calls for the Tucker family....

Stan's unflattering comment was addressed to Joop and so it could not be an insult to. As a professional teacher, your verbal skills are weak if you don't understand that. Also Stan's advice was perhaps even too restrained to be considered fair comment about a jerk who seems to spend much of his waking hours trying only to disrupt and damage these amateur radio newsgroups. Now THAT was an insult. Geddit?

If you dislike radio amateurs, why not find a hobby with colleagues with whom you fell a better affinity, instead of unhealthily and endlessly obsessing about this one? You behave as if the hobby somehow jilted you and you just can't get over it and get on with your life.

Why do people apply for a Tech Plus license and then choose to stay there? Is this because the application was really only made for 10m phone access or does it indicate a change of mind? I find it hard to believe that that anyone who regularly fires up in the novice code segments can avoid getting to general/advanced code speed within a very few months without even trying. Does anyone know of the true case of a novice cw operator who failed to acquire the higher speed after frequent operation over a period of time?

This time, Chuck, you are going to need to brush up on your Chinese if
you want to talk to the local QRM out here. And don't bother putting up
the ten meter beam, they have HF rigs that work on ALL the ham bands.
Seems the only thing they haven't figured out is the difference between
USB and LSB..... but there's plenty of them, you won't have any trouble
finding them when the sunspots start working again.....

O yes this is 14.313jr. If you like White TRASH this is it so
the person running the net said. I think it's not white TRASH but
14.313jr TRASH. Again our FCC and ARRL are doing a poor job of keep the
BAND CLEAN of CB TRASH! :(

> just another method, right?

Yeah, but it has NOTHING to do with amateur radio. And cw is an extra
enjoyed by many more than just a few and more than 80% of the hams
listed in the U.S. FCC database have passed a code test. That's not
saying that 80% of the hams use it but it is less than 20% who are
complaining about it. The reason those complaints seem so loud is
the media they are using.

When you read someone's posting or packet it has your
100% undivided attention whilst you are reading it, and that is why
replies tend to become so emotional. Many of these people give no
thought to what they are posting and go off half-cocked using
comparisons and analogies that have no relationship whatsoever to
amateur radio. They pretty much ruin any credibility they might
otherwise have.

Gaussian noise is what we call white noise. It is a statistically random
distribution of noise energy with a "flat" distribution curve. Actually,
what we're really discussing here is called *bandlimited Gaussian noise*.
True gaussian noise has an infinite energy because it has finite energy
at every frequency over an infinite bandwidth. Bandlimited gaussian noise
has a flat distribution, but over a finite bandwidth, so it has a finite
noise energy.

Well I think that CW is a Dying Art Form. It's a part of Amateur Radio and Should and always be keeped. Now I'm a NO-Code Tech. and don't plan to get HF due to all the QRM. VHF and UHF is more my thing. I never cared for DX on the CB and I still don't on ham radio. But I do know CW and can read about 13 words a Min. I do think Amateur Radio is not like it use to be. Now you just go to the store buy your Radio, Ant, Cable's, and ect. Building rig's and other parts are gone too. Now there trying to remove CW witch is no longer good for sending messages for the Gov. For computer's have taken it's place. But this is not the Gov. this is A HOBBY and CW is part of it. As fare a "enhanced CBer's" Well I see no real difference from CB and Ham radio. Most CBer's like Most ham's today love to talk DX and if you don't your going to DIE or your head is not on to tight. I run across this becouse I HAVE NO use for DX and like just local QSO with my friends. I moved off CB becouse of all the TRASH and DXing witch I careless for. But I still till people about DXing and if you like it on CB you'll love it on HAM. For it's all the time on HF.

I think you get the point. Amateur Radio is a HOBBY! So you all better get out your code key's and start learning CW!!! If you want HF so bad. If not Talk to me on VHF or UHF! :) Right my friend!

If code is droped then Amateur Radio is done for! 14.313 all
bands! For CBer's will come to HAM Radio and bring there TRASH with them.
:(Plus you see now that the FCC and ARRL can't stop CBer's now with a Ham
License just think how it will be WITH NO CODE AT ALL!

Thank about it! :(

As usual, the ARRL misses the mark. The problem isn't the SPEED level of code required; the problem is that CODE is required. What part of "Morse is no longer relevant as a testing element" don't you people understand?

Kill the code and the numbers will begin to rebound. Keep requiring the code and the hobby will die. Which do you want?

From: Phil Wheeler <w7ox@ix.netcom.com>
Message-ID: <3315A1AF.7480@ix.netcom.com>
Source record: 203559

Hmmm..Meant to reply to the thread, but I marked the newsgroup as "read" and then found out my message was bounced for some reason. I will try to reconstruct it here.

Back when I started out, in 7-land in the early 50's, the term California Kilowatt was used to suggest a station was running way over legal limit (mayby 2 to 3 times) because his signal was so strong. Lots of times it was a matter of phenomenal propagation, I'm sure (like the two South Africans I worked on 80 CW who had 599+ signals in Oregon in 1954; the first I thought to be a phoney, the second made me wonder, and the QSL cards verified they were real).

I actually saw a "California Kilowatt" mobile station last year. Fellow had four one KW or so tranmitters in his back seat, each fan-cooled -- with the whole thing run off of an exotic battery arrangement charged by four 12 vold alternators running in series. A true, classic "California Kilowatt". And, appropriately, his call was a 6-area call and we were in California when I met him.

Alas, my mobile setup only runs 100 watts!

Phil...W7OX

Because we don't wish to undergo the 13WPM General hazing ritual. 5WPM
was trouble enough.

>Is this because the application was really only made for 10m
>phone access or does it indicate a change of mind?

Actually, I decided to subject myself to the 5WPM haze only because I had
an HR-2510 laying around that I wanted to use on 10m.

> I find it hard to
>believe that that anyone who regularly fires up in the novice code
>segments can avoid getting to general/advanced code speed within a
>very few months without even trying.

Most novices/tech-plusses use only the phone segments. When the band is
open, I hear very little activity from 28.1-28.3.

Code sucks. Let's disconnect the artificial life-support systems that are
administered on amateur radio and let it die a dignified death as everyone
else has done.

>No apology is necessary. The poster that made the original comment is a
>racist and a bigot, both of which have NO place in amateur radio.

Better start listening on HF, Mikey. I hear quite a bit of what you would consider "racist" and "bigoted" comments on amateur radio. The Internet is not "amateur radio" but 20 and 75 meters is. I would suggest you have a talk with the folks down there if you have a problem with this kind of subject matter on amateur radio.

> I mean, look how closely he associates with the lowlifes on 75

Not very close association, given the fact that I have never talked to anyone there and don't even own a radio capable of transmitting on 75m.

>and lets
>never forgot his comments concerning the riots in Florida last summer
>(check out dejanews for more information)

I'll save you the trouble. I referred to those who rioted, looted, burned buildings, and destroyed the property of others as "black animals." That was a correct assessment based on the facts, and I stand by it. According to all news reports, the perpetrators were 100% black, or of "African-American" descent, as the PC types would phrase it. My opinion is that anyone who wantonly destroys property in this manner, especially in their OWN NEIGHBORHOOD, is behaving like a savage animal. Hence, the term "black animals" is a factual description of those who participated in these crimes.

>I'm really amazed that various gay and lesbian groups haven't taken his
>various homophobic postings and delivered them to his radio employer
>(that he routinely represents he works at, at least).

Unlike you, Mikey, most people realize there is no connection between the opinions that an individual expresses on his own time while exercising his right to free-speech and the employer whom the individual works for. No connection whatsover. Moreover, most people realize the adverse legal implications of harrassing an individual's employer in an attempt to have his employment terminated because of opinions he has expressed on his own which have nothing to do with his job or his employer.

>the QSL cards verified they were real).

Don't discount propagation and an effective antenna system as the reason a DX station is so loud. One DX contest, I heart YT1A (if I recall the call correctly) so incredibly loud that I assumed he had to be way over the legal limit. At the time, I was prowling around, seeing if I could get any of the DX stations to hear my 1 milliwatt station. I gave him a call. He came right back to me and got the exchange on the first try! I then figured out he had a real effective station (because he heard my real QPW signal so well) and the band was about as good as it gets.

In my opinion, one of the best ways to document something is to
write it up for publication so that others can critique it. Being
able to troubleshoot something you designed over the phone is an
excellent indication that you know the circuit well --Zack Lau W1VT

I have read many messages about newer FT-50s being un modifiable.
yaesu's response is the opposite. Lets find out why these
hams are having trouble modding their HTs(before I buy one) hihi..
Here is my reply from Yaesu.

==========
As for the FT-5OR, all versions are Mars/Cap modifiable.
The note you read was untrue and oviously unfounded. All
radios currently produced by Yaesu are Mars/Cap modifiable
lf you have any additional questions or I might assist you
further, please feel free to contact me directly at
(310) 404-2700 ext. 271. I would be happy to assist you.

Best Regards

JohnLynn N6TVN

Burt,

It's my opinion that you go looking for trouble. You know what they say
about looking for trouble? You find it every time!! Hee hee!

As far as feeling superior to most Amateurs. That's really nice!
I'm glad you feel that way.

I remember getting into it with you over on the Relaynet years ago. You
were giving me the gears for sending out a general message of thanks to
all that replied to one of my polls. At the time I didn't realize that
it meant so much to you. I still don't understand why!

I don't know what you are trying to prove. Your message isn't clear.
Who was it that said Communication without intelligence is pointless?

Cheers!

HELP*
I've got a new-to-me TS-430 that looks like it has had a number of mods done to it, and maybe some undone. I'd actually prefer it to work as designed; at least until I'm more familiar with it.

My biggest concern is that the VOX and Send/Recv switches have been somewhat bypassed when in CW mode. Even if the VOX is on manual and the standby is on Recv, when you hit the key you're on the air. I've noticed that when you switch the mode from SSB to CW the frequency display goes up by 800Hz.

I've opened up the radio to look for any obvious mods. Unfortunately, there are so many components on the bottom (solder side) of the RF board that I'm not sure where to start. The only definate thing I have to go on right now is that PD wire coming into connector 9, and the WRC wire coming into connector 10 have been cut.

I'd sure love to hear from someone that has some experience with these radios that wouldn't mind walking a newbee through some of this.

Thanks,

--

To all radio amateurs

SB PROP ARL ARLP009
ARLP009 Propagation de KT7H

Here was one more uneventful week, still at the bottom of the solar cycle. February 21 and 26 had some geomagnetic activity, but otherwise all was quiet. On most days the sunspot number was zero, and on every day the solar flux was less than the average for the previous 90 days.

For the DX contest this weekend, don't expect any big change. Solar flux should continue in the low seventies, and don't expect any unsettled or stormy geomagnetic conditions until March 7-10 and again around March 16. Based on the previous solar rotation, the solar flux could go to the high seventies toward the middle of March. Twenty meters should remain the best band for worldwide propagation during daylight, followed by 40 meters after dark.

Sunspot Numbers for February 20 through 26 were 0, 0, 0, 0, 11, 12 and 0 with a mean of 3.3. 10.7 cm flux was 72.6, 73.2, 73.5, 74.6, 74.6, 74.1 and 74, with a mean of 73.8. Estimated planetary A indices for the same period were 4, 10, 6, 9, 8, 5, and 13, with a mean of 7.9.

AMSAT SCRAMBLING TO CLOSE FUNDING GAP, COMPLETE WORK

The AMSAT-NA Phase 3D fund-raising campaign is at minus $150,000 and counting--and that's assuming the launch goes off on schedule this summer. At the end of 1996, AMSAT-NA figured it needed another $200,000 to finish the project. The latest AMSAT-NA fund campaign has, so far, netted an additional $50,000, according to AMSAT-NA Executive Vice President Keith Baker, KB1SF. "Barring unforeseen problems from now until launch, and assuming the early July launch date holds, that puts us still short of funds by about $150,000," Baker said this week. "We're still not out of the woods yet, but we're getting close." But the AMSAT-NA shortfall is only part of the total Phase 3D funding picture. Baker also says that AMSAT-DL (Germany)--which, so far, has invested nearly $2 million in Phase 3D compared to nearly $1.4 million for AMSAT-NA--reports it still needs in the vicinity of $100,000 to complete its share of the Phase 3D effort.

Baker said AMSAT is on target to meet the July 8 or July 9 schedule, which is still the official European Space Agency launch date for the Ariane 502 rocket.

Baker said work on the satellite is moving along swiftly, and most of the remaining electronic modules, antennas and other pieces of the satellite are now at the Phase 3D Integration Lab in Orlando, Florida. "This week, a number of our Japanese and European builders will also be in Orlando, along with several of their American counterparts, to begin the 'final-final' installation and test of antennas as well as integration into the satellite and testing of RF and the remaining equipment modules," he said. "They'll roll up their shirtsleeves to get the work done." That phase of the job will continue through March. Environmental testing of the satellite is slated to begin in mid-April.

The schedule is a tight one, right up until launch time. AMSAT anticipates the satellite will be shipped to Kourou, French Guyana, sometime in early May for final checkout, followed by integration with the Ariane 5 rocket in mid to late June.

"Needless to say, it is a very busy (and exciting) time for all of us!" Baker said.

A series of pictures of Phase 3D work in progress is available via the AMSAT-NA Web site at http://www.amsat.org. Depending on its workload, the integration team hopes to be able to update these photos as work progresses.

SCHOOL CONTACTS ARE A "GO" IN THE WAKE OF MIR FIRE

A ham radio contact between ham-Astronaut Jerry Linenger, KC5HBR, aboard the Russian Mir space station , and pupils at an elementary school in Michigan went off on schedule February 27, unaffected by a fire aboard Mir a few days earlier. Linenger, a physician, reported no injuries and all crew members in good health following the incident on February 24. A problem with an oxygen-generating device on Mir set that off fire alarms and caused minor damage to some Mir hardware. The damage resulted from excessive heat rather than from open flame. The fire was in the Kvant 1 module.

The Mir fire was a popular topic as pupils at Charlevoix Elementary School in Michigan spoke with Linenger Thursday morning. A crowd of 320, including reporters from four television stations and three newspapers, was on hand as 15 Charlevoix pupils spent ten minutes talking with Mir. The operator was Craig Stewart, KB8KPV. Regarding onboard emergencies, Linenger told the pupils that there is a crew return vehicle on each end of Mir, if something goes wrong, and he assured the youngsters that everything is fine now. He also mentioned that he misses pretzels and now eats about 50% Russian and 50% American food. "The students were all very excited and really enjoyed their contact," said Frank Bauer, KA3HDO, AMSAT vice president for manned space flight. Three schools in Texas hope to have a chance to talk with Linenger over the next few weeks.

The fire last Monday burned for about 90 seconds. The crew was exposed to heavy smoke for five to seven minutes and donned masks in response. Medical personnel directed the crew to wear goggles and masks until an analysis of the Mir atmosphere could be completed.

Lithium perchlorate candles are burned to generate supplemental oxygen when more than three people are on board the space station. The oxygen-generating

candles usually burn for up to 20 minutes. Russian officials believe the problem began when a crack in the oxygen generator's shell allowed the contents of the cartridge to leak into the hardware in which it was located. Crew members extinguished the fire with foam from three fire extinguishers.

The heat destroyed the hardware in which the candle was burning, as well as the panel covering the device. The crew also reported that the outer insulation layers on various cables were melted by the heat. Russian flight controllers say that all Mir systems continue to operate normally, however.

"It is unfortunate that this incident occurred, but we are thankful that there were no injuries," said Frank Culbertson, director of the Phase One Shuttle-Mir program. "Russian management and operations specialists have been very informative as to what happened, and we are working closely with them on evaluating the health of the crew and how best to respond to the damage," he added. "The crew did a great job handling the fire, and the ground support has been excellent on both sides."

Other schools hoping to speak with Linenger via ham radio include Perryton High School, Perryton, Texas, on March 4; United South High School, Laredo, Texas, on March 11; Booker T. Washington High School, Houston, Texas, on March 17. For a look at the Mir "ham shack," check out http://shuttle.nasa.gov/sts-81/images/Postflight/lores/81343014.JPG. (Can you find the ham rig in this picture?--Ed).

In addition to Linenger, the Mir crew members include Mir 22 cosmonauts Valery Korzun and Alexander Kaleri, Mir 23 cosmonauts Vasily Tsibliev and Alexander Lazutkin, and German researcher Reinhold Ewald, DL2MIR, representing the German space agency, DARA. Korzun, Kaleri and Ewald are scheduled to return to Earth on Sunday, March 2, wrapping up a six-month mission for Korzun and Kaleri and three weeks of scientific experiments for Ewald. Linenger will remain aboard Mir with Tsibliev and Lazutkin until mid-May.

Officials are evaluating possible impacts of the fire to the mission and its science activities, as technical experts at the Russian Mission Control Center investigate the incident. The burned panel and other materials may be returned to Earth with Korzun, Kaleri and Ewald on Sunday for further analysis.--NASA; Rosalie White, WA1STO; Frank Bauer, KA3EDO

AUCTION OF MARCONI MEMORABILIA CALLED OFF

The controversial Marconi auction is off! Under pressure from Marconi family members and others interested in preserving the Marconi heritage, GEC-Marconi has put on hold an auction of rare memorabilia from the collection of Guglielmo Marconi, the man usually credited with the invention of practical wireless. The items were scheduled to go on the auction block at Christie's South Kensington auction house in London during a two-day sale, April 24 and 25, 1997, but GEC-Marconi spokesman Alan Tull said this week that it's now "very unlikely" that will happen and that the company was negotiating to withdraw the collection from public sale altogether.

"It's quite a complex process," said Tull, who's GEC-Marconi's director of public relations. Tull said the current talks involve a third-party benefactor who has come forward with "a viable, businesslike proposal" to ensure long-term safekeeping of the collection. Tull said the "vast majority" of the collection consists of ephemera--mostly documents--and maintaining it involves "very big money" that GEC-Marconi was apparently unwilling to spend.

"We're a defense company, we're not in the museum business," he said.

The items scheduled to be sold have been in the GEC-Marconi Museum in Chelmsford, England. Tull said the current negotiations, which also involve the Science Museum of London and "certain interested parties," are going well. "We're working towards some kind of a solution so that we can retain the collection intact and in the UK," he said. GEC-Marconi wants "to do the right thing" to ensure public access as well as long-term safekeeping of the collection, he said. The collection's final location is still up in the air.

The sale was expected to bring in ?1 million (approximately $1.6 million), which GEC-Marconi said was to help fund an endowment that would be used to train budding electronics teachers. GEC-Marconi was holding the sale as part of its Marconi centenary celebration.

Ray Minichiello, W1BC--the founding chairman of the Guglielmo Marconi Foundation USA Inc in Bedford, New Hampshire, was overjoyed about the turn of events. "This is good news, really!" he said. Minichiello's father was a friend of Marconi's, and Minichiello himself had met the famous inventor. Marconi died of a heart attack in 1937 at age 63.

British press reports show that Marconi's daughter, the Princess Elettra Marconi-Giovanelli (with support from her son and Marconi namesake, Guglielmo Giovanelli-Marconi) exerted her influence to get GEC-Marconi Chairman Geoffrey Pattie--a Member of Parliament--to rethink the sale. In a letter published February 10 in The London Times, Elettra Marconi said she was "appalled" to learn of the pending sale. "At all costs, these archives should remain in the UK and preferably in the town of Chelmsford, where the work of my father began," she wrote. A news report in the same edition by Science Editor Nigel Hawkes outlined the effort to keep the collection intact and in England. Earlier in February, the Princess also had faxed Pattie directly on the matter, expressing hope that GEC-Marconi's board would reconsider its plans. "These items are part of English heritage," she said, adding that it "would be shameful for these items to be sold overseas." Elettra Marconi called it "most hurtful" that one of the planned sale dates, April 25, coincided with the anniversary of Marconi's birth. Minichiello said Elettra Marconi even "took to the airwaves" of the BBC to make her case.

According to Christie's auction brochure, the collection "comprises an important cross section of early equipment and experiments" as well as "important technical, business and personal papers." Among the individual items is Marconi's 1896 first patent for "Improvements in Wireless Telegraphy" (estimated to be worth $1600 to $2400). The collection also includes some of the earliest recorded wireless messages, including the

first use of wireless to report on a sporting event--the Kingstown Regatta in Dublin, Ireland, in 1898 (estimated value, $4700 to $7900).

A number of early tubes ("valves") developed by John Ambrose Fleming also are in the collection, as is Fleming's November 1904 letter to Marconi in which he reports the invention of the "valve" for the first time, and declares, "I have not mentioned this to anyone as it may become very useful." Christie's estimated one such "valve" to be worth up to $13,000.

Other items include a circa-1900 Marconi coherer receiver (valued at between $23,600 and $31,500) and an early microphone featuring a mouthpiece fashioned from a cigar box, worth up to $12,600.

The Guglielmo Marconi Foundation USA Inc plans to open the US National Marconi Museum in Bedford, New Hampshire, this summer. Minichiello said the museum "hopes to borrow" some of the Marconi memorabilia, although he said he did not anticipate having the chance to display any of "the most priceless items" from the collection.

CANADIAN FLAP ERUPTS OVER LITTLE LEO INVITATION

Radio Amateurs of Canada is warning hams north of the border not to be taken in by what it believes might be a "divide and conquer strategy" by the Little LEO industry. On February 22, RAC issued an advisory to all clubs stating that "representatives of large telecom corporations" were approaching Amateur Radio clubs to explain how it would be feasible for the Little LEO and hams to share spectrum in the 146, 220 and 440 MHz bands. The low-earth-orbiting (LEO) satellites would provide data services.

But the Canadian ham club that's at the focus of the flap says RAC has it all wrong. The Kitchener-Waterloo (Ontario) Amateur Radio Club (KWARC) said it extended the invitation to a representative of ORBCOMM Canada to speak at its April 7 meeting on how its current LEO satellites already share public safety and commercial frequencies. Via its Web page (http://www.kwarc.on.ca/), the club defended its invitation to ORBCOMM Canada as an open-minded effort to get all the facts. "I am one of the strongest supporters of the RAC, however at this moment in time I am very disappointed at this latest misguided attack on KWARC," said Paul Cassel, VE3SY, in an editor's note. "I continue to oppose any sharing of our 2 meter or 70 cm spectrum. However, I do support an open dialogue be undertaken by the LEO Industry and the Amateur community to discuss joint experimental sharing at 220 MHz. I feel this band best suits the interests of the Amateur Community to experiment with spread spectrum sharing and should meet the needs of the LEO applicants."

In its advisory--signed by RAC President Farrell Hopwood, VE7RD--RAC suggests that a club's "hospitality and broadminded reception" of industry speakers could be turned against hams. RAC says that after briefing clubs like KWARC, the Little LEO industry could approach government claiming it consulted with hams across the country who "greeted them warmly and did not disagree with their ideas."

Citing mutual interference and the future erosion of ham radio's presence in the face of commercial encroachment, RAC said it is "absolutely opposed" to any loss of spectrum and to sharing with the Little LEO satellites. "The eventual loss of our VHF and UHF bands would seriously jeopardize the future of Amateur Radio," RAC declared.

RAC said it would do everything it can to "dissuade government and industry from forcing us to share our bands for what we believe is an ill-conceived program, fraught with problems for amateurs and the public." RAC has posted its position on its Web page at http://www.rac.ca.

CANADIAN EFFORT TO DELEGATE HAM RADIO ADMINISTRATION STALLS

An effort to delegate the administration of the Amateur Radio service in Canada to a nongovernmental service company has stalled at the eleventh hour. The arm's-length organization affiliated with Radio Amateurs of Canada and known in English and French as Amateur Radio Administrative Services/Services Administratifs Radio Amateurs (ARAS-SARA) has been incorporated as a not-for-profit company under Canadian law and has financial help from Industry Canada, that country's FCC. Its stated purpose is "to provide spectrum management administrative services to all individuals who wish to operate an Amateur Radio Station in Canada." The project calls for ARAS-SARA to assume some ham radio administrative responsibilities for that country's 47,000 radio amateurs--going beyond what the highly successful volunteer examination program does with ham radio examinations here in the US. One of the reasons behind RAC's recent move to Ottawa, ARAS-SARA was considered to have been on the verge of approval and was expected to be implemented on a limited basis later this year.

"February 18th was truly Black Tuesday," said an RAC bulletin reporting that senior Industry Canada officials "abruptly shelved the program for the delegation of the administration of the Amateur Radio Service on the eve of final approval of the project." The major stumbling block seems to have been the lack of a decision on money. Industry Canada's Jan Skora--director general of the Radiocommunications and Broadcasting Regulatory Branch--advised RAC President Farrell Hopwood,VE7RD, that his department had decided not to commit to long-term funding of ARAS-SARA at present, because it was too risky.

As RAC interprets the issue, lacking approval of a mechanism permitting the ARAS-SARA to keep a portion of the license fees it would collect, Industry Canada was skittish about going forward with the program. A decision on that issue is expected later this year. The approval would be needed so ARAS-SARA eventually could be completely self-supporting

"Contrary to its previous position, Industry Canada apparently has decided that until it has that decision, it is now unwilling to provide support in next fiscal year for the first phase of the project, which is the startup and test of the new service concept," the RAC lamented.

RAC says it plans to pull back financially from the project but will continue to monitor the situation. "The ball was clearly in Industry Canada's court to finalize the funding and secure Government approval," said

RAC Vice President, Government Affairs and working group cochairman Jim Dean, VE3IQ. "This eleventh hour decision very significantly jeopardizes the project."

A full report will be included in an upcoming issue of The Canadian Amateur.

SOLAR SAME OL' SAME OL'

Solar seer Tad Cook, KT7H, Seattle, Washington, reports: This was one more uneventful week, still at the bottom of the solar cycle. February 21 and 26 had some geomagnetic activity, but otherwise all was quiet. On most days, the sunspot number was 0, and on every day the solar flux was less than the average for the previous 90 days.

For the ARRL International DX SSB Contest this weekend, don't expect any big change. Solar flux should continue in the low 70s, and we should not see any unsettled or stormy geomagnetic conditions until March 7-10 and again around March 16. Based on the previous solar rotation, the solar flux could go to the high 70s toward the middle of March. Twenty meters should remain the best band for worldwide propagation during daylight, followed by 40 meters after dark.

Sunspot numbers for February 20 through 26 were 0, 0, 0, 0, 11, 12 and 0, respectively, with a mean of 3.3. The 10.7-cm flux was 72.6, 73.2, 73.5, 74.6, 74.6, 74.1 and 74, respectively, with a mean of 73.8. Estimated planetary A indices for the same period were 4, 10, 6, 9, 8, 5, and 13, respectively, with a mean of 7.9.

IN BRIEF:

* This weekend on the radio: ARRL International DX Contest, SSB (see Dec QST, p 104).

* FCC makes call signs available again: The FCC is making available six amateur station call signs to vanity applicants who file applications on or after March 27, 1997. The call signs are W0AW, W3RO, W4CC, W4ART, W7MT and K7JW. These call signs will be available because they were surrendered by or taken back from licensees who were not eligible to hold them. For more information, call the Wireless Telecommunications Bureau's Consumer Assistance Branch, 800-322-1117.--FCC

* Astronaut makes terrestrial DXpedition: Ham-astronaut Chuck Brady, N4BQW, will be on the air from Midway Island (KH4) and from Kure Island (KH7) 40 miles away, February 27 until March 6. He's on the Pacific island for the closing of the Naval Station there. While in the Pacific, Brady hopes to operate HF (including some RTTY) and 2-meter FM. Look for him on or around 14.195 MHz SSB.--Matt Bordelon, KC5BTL

* New Mir ham radio Web site: To provide information on SAFEX, the Space Amateur Funk EXperiment aboard the Russian space station Mir, the DLR Amateur Radio Group DF0VR at Oberpfaffenhofen, Germany, has installed a new Web site at http://www.op.dlr.de/~df0vr/home.htm.--Rudolf Appel, AMSAT-DL

* New Premier marketing director: Ken Collier, KO6UX, is the new marketing director for Premier Communications, which distributes ADI products. Collier has written for QST, most recently "Highway to Help" in the FM column.

* SC Section Web site: A new Web site for the ARRL South Carolina Section is now operational, thanks to Dave Crockett, WB4DFW, who's Clemson University's webmaster. It's at http://wb4dfw.clemson.edu/public/qst.html. The page contains information on nets, operating aids, links to several sites, and a listserver. Steve Szymanski, KQ4OU, the section bulletin manager, will distribute W1AW bulletins and The ARRL Letter via the listserver. Subscribe by sending e-mail to listserver@pubaff.clemson.edu. No subject is necessary. On the first line of text type: subscribe arrl-sc {first name} {last name} {call sign--optional}. Subscribers should receive an acknowledgment by return e-mail in about five minutes.--Dave Berry, KE4W, SC SM

* WAAS Award: The Worked All Analog Satellites Award is available to those who have worked through particular analog spacecraft between January 1 and July 1, 1997. Submit all claims by December, 30, 1997. The application fee is $3. QSL cards are necessary for proof. There are two classes. The Class II award is for contacts through AO-10, AO-27, RS-10, RS-15, FO-20, FO-29, and Mir (presumably SAFEX). The Class I award adds RS-12, for a total of eight satellites. For more information, contact award manager Josef Maier, OE3JIS, Box 116, A-1172, Vienna, Austria.--AMSAT News Service

* Northern California Emergency Response Institute: The Northern California Emergency Response Institute will be held May 17-18, 1997, at the Sacramento Municipal Utility District's Energy and Technology Center in Sacramento, California. Classes will include a debriefing on the recent Northern California flooding, a discussion on the many uses of technology in Emergency Services operations, using the Internet in Disaster Operations, Training the Trainer, working more efficiently with governmental agencies, and more. To register: Visit the ERI '97 Home Page at http://www.garlic.com/oes/eri/eri97.htm; send e-mail to larton@garlic.com to request a registration information packet; or write ERI '97, Box 301, Fair Oaks, CA 95628. The fee is $20, payable to ERI '97. Questions? Contact Institute Director Dave Larton, N6JQJ, tel 408-778-7265; fax 408-778-3101; e-mail larton@garlic.com.

What happens in one service isn't always relevant to other services.
Hams dropped AM in the 60s and the FCC eliminated AM from the marine
bands in the mid-70s, yet every nation world-wide is still using
AM for its domestic and external ("shortwave") broadcasts.

The military is using HF SSB less and less, yet hams still and will
continue to use it for a long time to come.

If you want to do what the military does, why not enlist?

A little clarification is needed here, Jerry (and any others who may not have killed this thread yet). I am NOT a BBS sysop. However, I do have the honor of serving as the President of the local packet club, responsible for a portion of the network in our area.

My original reply post simply pointed out that the first station in a forwarding chain is responsible for content, per FCC rules. I put in that little line, because K1OIK had not said exactly WHAT his gripe was, merely that he felt sysops did not believe in free speech. (I did agree, however, that I would not want pronouncements and diatribes of the type I have seen lately being distributed with the help of my personal equipment, whether I owned a BBS, or voice repeater, for that matter). I can now see why some repeater systems are "closed".

I have watched this thread with some interest since then, but not added any other comments until now. I now, of course see that Burt may have been locked out of some systems, not so much due to the strict legality of his message contents, but simply because some equipment owners do not wish for their equipment be used to disseminate Burt's twisted tirades.

I do not personally believe that posts of the nature that Burt spews do anything to promote Amateur Radio, nor are they providing constructive opinions of how the current situation (as he sees it) may be improved. He professes to have lofty values and precepts on the subject of humantity in general, but I don't see anything but bitterness coming across my screen. His own Web Page offers a list of quotes he claims to espouse as his view on humanity, but there is one listed there from Ralph Waldo Emerson on the subject of "success" he

should reread (or remove). "...to find the best in others...". I just
don't see that happening.

Best wishes to all... (even Burt).

Jeff,

I'm agree with everything you say except one point and valid it is.As far as an amateur HT not being able to withstand extreme temperature changes such as fire I can only say one thing.Being in the two-way business for almost 10 years I have seen many commerical versions not survive fire any better then a fireman carrying his personal amateur HT.Also the case on the COMMERCIAL Vertex VX-10 is identical to that of any Yaesu ft-10,40 or 50.I know, I've had them both apart.The ft-10 and VX-10 are identical except for programming in the micro.

All you'd see on the monitor is a small, very bright spot, whether you're
using an IR LED array or even a flare. Remember, the camera is looking
at a rather large area, compared to the size of your body. The only
thing this "optical jamming" system will do is draw the security guy's
attention, as you will be the only person in the store carrying a beacon...

According to a survey of ARRL members, who are, per-capita, much more
pro-code than most of the 3/4 of hams who are *not* ARRL members, only
40% of them (ARRL members) EVER use Morse code ...

40% of 25% is less than 20% of ALL hams ... it's a very small minority.

Your assumption that a no-code ham who passed all the written tests (up
through and including extral level, perhaps) would be a "fool trying to
transmit 2kc away talking pointlesssly" is not supported by any logical
basis that I can see ...

Knowing Morse does not convey any knowledge of rules, courtesy, good
operating practices, or the amount of space he should give your signal.

Your argument, which is obviously pro-code, is also obviously based on
some other reason for wanting to keep code tests than the reasons stated.

BTW ... the industry stopped using "kc" MANY years ago ... the correct
term is "kilohertz" and the abbreviation is "kHz" ... your slip belies your
age (or at least the age of your views/technical exposure) ...

Horseback riding is still at viable form of transportations by means of
which
most of this vast country was originally tamed. Should not horseback
riding
be a pass/fail test element on the Dept. of Motor Vehicles driver's license
test? (that make every bit as much sense as Hubbard's support for Morse
tests)

>
> Carl,
>
> To be a heretic, you have to preach against the orthodoxy and I am not
> sure what the orthodoxy is in this case.

The orthodoxy is mandatory code testing for access to HF and the
fixation the ARRL and the pro-coders have on increasing code speed
as "THE measure of a 'good' ham" ...

> It may be the feeling that for some reason you have to show more
technical
> expertise to operate in the HF region than in the VHF region. That has
> been settled also.... How much more technical expertise does it take for
a
> General or higher class operator to fire up a medium power transceiver on
> 75 or 40 ssb than it does a Novice or Tech Plus to fire one up on 10
meter
> ssb?.

Neither HF nor VHF/UHF require any real technical expertise to be an
appliance
operator ... some knowledge of theory, interference and its' causes and
remedies,
and rules/regulations would likely be enough for a communicator service
using
type accepted radios with no permission to build, tune, adjust, tweak, or
twiddle.

However, since we're allowd (actually somwhere at least between
encouraged
and *expected*) to build, tune, adjust, tweak, twiddle, experiment, and
invent,
a rather higher level of knowledge is actually required for either ...

There is essentially no differentiatingly large difference in the degree of
technical
"skill" between HF and VHF/UHF amateur operations. It's just that HF is
"better" because of the ability to communicate on a global basis (without
the
need/limitations of satellites) and the incumbents feel very stongly that

Morse
is "THE measure of a 'real' ham" and that "one must 'earn' one's HF privs
by
enduring the fraternity hazing ritual. Most are not honest enough with
themselves
to admit their real reasons for this instistance, so they invent a miriad
of
bogus,
ridiculous "reasons why the code must be kept" as alternatives.

> All of these questions have been asked and answered. I could take a real
> heretical approach and make a case
> that it really takes more technical expertise to operate with full
> privileges on VHF than it does on HF. In many cases, VHF TVI, RFI, BCI,
> Baby Monitor FI and other FIs can be a bigger problem on VHF than on HF.
> Antennas for any kind of long range work are more critical.
Communications
> modes such as the various forms of scatter require better operating
> technique knowledge than typical ionospheric propogation in the HF range.

> The care and feeding of high power amplifiers at VHF and UHF require more
> attention than at HF.

You are correct ... at increasingly higher frequencies, parasitic Ls and Cs
in
circuits, crosstalk, and other "gremlins" are more pronounced in their
effects.
If one wants to "slice the cheese thin enough" VHF/UHF operation would
take more technical skill than HF ...

> Maybe we have been doing this all wrong.... maybe you should have to have
> an advanced form of license to operate in the VHF region..... hi.

It's called "technician" ... it's very advanced in one respect ... it
doesn't
require
that one waste endless hours in attempting to achieve a Pavlovian
conditioning
of one's wetware to emulate a grossly poor and inefficient modem and data
coding scheme that was invented in 1847. This test for this class of
license
cuts straight to the salient task of attempting to verify that the
applicant has
at least a minimal (per the government's standards) knowledge of the theory
of radio, rules and regulations, and other material that the government
says
are necessary to operate an amateur radio station without posing a
significant
danger to one's self, the public, or other radio services ... why should
access
to HF require more??? (whether the technician test is sufficiently
rigorous

in the technical area is the subject of some debate, but that is a
different
question than "Why is code testing necessary for HF?" ... the ITU treaty
notwithstanding ...)

So behaving like Nero and fiddling while Rome burns like the ARRL is
going to solve anything? (Actually in this analogy, the ARRL is the
prime arsonist ...)

I didn't suggest destroying anything of any value ... I made the statement
that the ARRL "is the enemy" ... in other words, I fervently and quite
sincerely believe the ARRL has done and is doing FAR more harm than
good.

I am confident that a better, more effective, progressive national
organization
can and will rise in the near future and take the reigns to rescue ham
radio
from the ARRL and guide it into the 21st century ...

I'd even be willing to begin accumulating a database of e-mail addresses
and callsigns (callsigns not required) of folks who feel similarly ... that
way I can provide an instant mailing list to such a group when they step
forward ... anyone who wants to be on the list, please e-mail me your name,
address, and (if you have one) callsign ...

AMSAT ... which developed the Microsat concept ...

TAPR for it's pioneering work in digital communications and spread spectrum
technology for ham use ...

Phil Karn for his work on TCP/IP, coding schemes, etc.

Ron Raikes (WA8DED) and Mike Busch (sp?/callsign?) the developers
of NETROM (with shame to the German group who stole NETROM,
decompiled the code, and began distributing it as "freeware," claiming it
was an original work ...)

And a few thousands of others who *are* building, experimenting, and
exploring.
They are a minority and that is a major disaster for ham radio ... but they
do
deserve to be recognized ....

> to you, then???

I debated that issue with myself at length at last renewal time. I
ultimately
decided to renew my subscription to QST one more time so I could keep an
eye on the bastards ... I knew that the code/no-code issue, ARRLs oppostion
to TAPR's SS STA, and other issues would be coming to a head.

I've since decided that there are far better sources of ham information
available
through other avenues without the need to contribute to the ARRL's
campaigns
to destroy ham radio ... so I am not planning on funding any more of their
ill-advised policies or lobbying efforts ...

I am perfectly capable of filing my own comments with the FCC, have done
so on previous occasions, and plan to in the future.

About 5/8 inch above the plastic case of the radio itself. So no, the
base of the BNC antenna will not fit snuggly against the radio.

Try a Comet SMA-3 rubber duck. I have one on my FT-50R and it works
great over a fairly wide frequency range.

>Courts have long held that "public figures" (such as radio DJ's) have
>a higher standard of behavior when it comes to issues like slander and
>libel.

I am not a "public figure", I am a private individual. The "public figure" standard you speak of is applicable to politicians, public officials, and possibly to radio talk-show hosts. It would never be held applicable to a priivate individual who's job happens to be playing music and producing commercials for broadcast since he obviously does not use his access to the airwaves as a forum to discuss political issues such as the one you are trying to raise here. In other words, his job has nothing to do with the issue(s) you would be attempting to raise against him.

>There is nothing illegal or slanderous about taking your postings,
>especially those in which you identify yourself as an employee of a
concern,
>forwarding them to your employer, and then organizing a picket of your
>employer because they employ homophobes.

At no time have I stated or implied that I speak on behalf of my employer. Furthermore, I have never posted any messages to this newsgroup on company time and/or from company facilities. All opinions are my own, posted as a private citizen, and have been posted on my own time from my own residence. Given these facts, you have no legal right to cause harrassment to my employer or to encourage others to do the same. I'm not an attorney (nor do I play one on TV), but it is my opinion that you are on shaky legal grounds here.

Go ahead. Test my theory. Any attempts at harrassment by means of contacting my employer in an attempt to have me to be terminated, suspended, disciplined, or to otherwise attempt to jeopardize my employment will be met with appropriate legal action.

Then why do we not have mandatory testing elements for...say, repeater operation or how digipeters work?

Come to think of it, that's not a bad idea. Much more relevant in this day and age than Morse code.

>Ditto for the US. Type-acceptance is not required for an amateur
>transmitter.

Right on the first part, but some tyupe acceptance is required, i.e. linear amplifiers for hf, and frequency coverage. To wit, the Alinco dj-580 was modified to become the 582 to comply with U.S. requirements, such as removing the 800-900 mhz cellular freqs.
It is quite legal to buy amateur equipment without a license, though using it without one is another story entirely, but there is type acceptance on quite a few items we use.

>and making amateur radio life miserable for each other.
I understand. Such groups have been part of the hobby for quite a few
years.
I remember, back in the '70's, about 1975 to be exact, the "Free thinkers"
a group of folks of the atheist persuasion who hung out on 3922 khz, then
there
was the group of young folks on 3968. I enjoyed listening to both groups,
but you should have heard the atrocious amount of jamming on both freqs.
It seems that if your view are controversial, and you choose 75 meters to
chat with like minded souls, there are quite a few morons who will jam your
freq just because they aren't articulate enough to state why the disagree
with you.
Btw, 75 meters is one of my favorite bands, for manhy reasons. The traffic
nets being only part of it, but the ability to enjoy good ragchews is
another.
The clowns who inhabit 14.313 and some other freqs do a lot of bad
publicity for the hobby, and are entertaining for awhile, but then I must
move on to something which actually is educational, or at least worth
listening to.
Try out the bunch on 3950 khz in the evenings if you want to really hear
some weirdness at times.
YOu might also catch a few things which the mainstream media doesn't
discuss.
AS for network television, I agree wholeheartedly. Nothing but bullshit on
the average cable and network channel, discounting the educational
channels, discovery, public tv, etc.

>Why is it considered acceptable, even encouraged, to post ham

>FCC enforcement was a way of life. You didn't have all the garbage
>on the band that you have now, and serious communication was
>actually possible and accomplished. Just because I now hold an
>amateur radio license does not mean I'm going to get rid of all my
>CB equipment and renounce having ever operated there. I enjoy both
>and make no apologies for this. Why should I? Again, it's just a
>hobby. Lighten up!

I was licensed as kgp8968 in 1972. I remember those days. I'm encouraging my lady to get her tech ticket now, as she must drive the highway to and from work every day with an older car, and I don't feel that she would get reliable help if she called for it using a CB radio. As a friend of mine from elsewhere said to me in an Email yesterday, she's more likely to get raped than helped.
Cb radio used to be worthwhile for families and others wishing a decent form of communication on a local level, but the jerks have made it impossible to do what was the intended purpose anymore.
I have zero respect for the cb radio disservice as it stands today. If I want to hear some beer drinking moron with an overmodulated signal, I can find them elsewhere, but I sure as hell don't want to hear them when I'm trying to be of help to a stranded motorist, etc.
In fact, we have more fun jamming the beer swilling overmodulated morons in our town.
One lives fairly close to a friend of mine, and we had a ball "Plugging his ears" for him.
I ask these hetorical questions as I really wanted to know. I've listened to 3894.5 khz enough, but usually I'm trolling for a good conversation to listen to, not a bunch of jerks. SHould I want to listen to morons, all I've got to do is tune in 27 mhz and there are plenty to choose from.

Btw, I could institute a Killfile, and if the signal to noise drops, might do that,
but at the moment, it's still somewhat entertaining.

Cross-posted to: rec.radio.swap,rec.radio.amateur.equipment,rec.radio.amateur.antenna,rec.radio.amateur.misc

<<< San Jose, CA. >>>

Had to take antenna down because of landlord.

37 foot Telescoping Mast originally designed to support a 10-80 meter inverted-V, but could be used to support a small rotor and beam (28mhz up to vhf/uhf).

Material used is schedule 80 PVC Tubing, in 4 sections, with O.D's: 3.50", 2.75", 2.25", and 1.75". The sections are held in place by a u-clamp and thru center eye-bolt arrangement. Each u-clamp has 2 outer eye-bolts, along with the thru center eye-bolt, which are used as guy points.

The bottom 3 sections use PVC sched 80 reduction union joints (very beefy) which I reamed out to allow upper sections to slide thru freely. The three over-lapping sections are over lapped by 12, 16, and 18 inches, from smallest to largest dia., respectively. Each upper section has 2 sets of 3 spacer bearings that take up the excess play inside each over-lapping section.

As you may well have gathered, I have an Engineering background and took some time designing this Telescoping Mast. It wasn't something I just threw together.

The last 2 years in San Jose, CA, has brought storms with winds as high as 75 mph. This Mast barely moved during these storms. Also, I use three sets of guys which are marine-type nylon rope that is UV resistant.

Mast is more durable and can withstand higher wind speeds than a steel mast, when guyed properly. Also, Mast doesn't interact with antenna like a steel mast would.

73,
-gary

My God, who are these people? Boycotts, conspiracies...you would think the
ARRL had ties to the Nazis...except this time, destroy Amateur Radio by
making the ops continue to learn CW. What a vile, inhumane plan.!!
Please stop this you idiocy.

deja vous ... all over again ... :-)

> I hope that for both our sakes and the the ARS that time will tell and
> that we all get what we are looking for

I am beginning to believe that you really do want the ARS to
survive and prosper ... I just think your approach is self-defeating
at times ... the code, the "incentive" licensing caste system,
the Balkanization of our bands, resistance to new technologies,
warehousing spectrum for vanity repeaters, and many other
ham practices, policies, and regulations that the ARRL supports
and promotes are the political/spectrum equivalent to mixing
crack cocaine and heroin ... while working the "high iron" (walking
the beams like an iron worker) 100 stories off the ground ... the fall
will be a real shocker!!!

You and I kind of got off on the wrong foot ... if I recall correctly
you smart-assed me on something and I called you a troll and
things went downhill from there ... (I never called you a Nazi,
and I'm not a racist or anti-semetic) ...

I actually prefer dealing with you on the more civil terms we
seem to be enjoying of late ...

OK, true, there are other reasons for my procode stance. I wont go into them
now...unless you ask and want to read a long post. As for my use of "Kc"
what can I say? Why should I say anything? Who cares? However, it doesn't
portray my age...I'm only 21. Age of views maybe. technical exposure maybe.
But again, whats the point?

>

First it may be easy to remove a jumper it is just the problem of which resistor or diode to remove that makes it difficult. Also by using your logic you could argue robbing backs is not agaist the law if you don't get caught. Seriously there are legitimate uses for amateur radios that transmit out of band such as use by people with valid MARS license and also many amateur operators use HF radios to drive vhf/uhf transveters and never transmit on frequecies where the radio must be type accepted.

Gee I hope your not a lawyer or logic designer. Let me write this a little different.

Fine and/or jail = operate a transmitter that requires a grant of equipment authorization (for the band your transmitting on) but for which no grant has been issued OR transmitting without a licence on a band that requires a licence.
Have fun. Good hamming.

Consider the RST (Readability Strength Tone) signal reporting system.
The Tone portion is applicable to CW only. The R and S have a range
of 1 through 5 , an an R5 S5 report is 5 by 5.

Does anyone know of a list of celebrity/famous people type Amateur Radio Operators? I can list,(pardon any spelling errors) King Hussain, Barry Goldwater, Walter Cronkite, Roy Neal, Chet Atkins, Bon Jovi, Stu Gillam. Could any of you add to this list? Its always nice to point these people out to non-hams when you're doing a presentation on Ham Radio.
Thanks and 73s,

HAMFEST/COMPUTERFEST CALENDAR 1997 - NORTHERN ILLINOIS
last updated February 8, 1997

o Please report additions or changes to Bob Parnass, AJ9S, office phone: (630)979-5414, electronic mail: parnass@bell-labs.com. Thanks to Dennis Dale and ARRL for providing some of the information.

MARCH 1997

Mar 2 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Mar 9 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Mar 9 (Sun) - Waukesha, WI. SEWFARS Swapfest. Waukesha County EXPO Center, Waukesha, WI 8:00 AM Talk-in on 146.820 pl 127.3 $4.00/$5.00 Ham Radio. Computers. Electronics. Amateur License Exams. For information Contact SEWFARS, PO Box 102, Delafield, WI 53018. 414-650-0724

March 23 (Sun): Grayslake, IL - LAMARS hamfest, Lake County fairgrounds. All indoors. Admission $5 at gate, free parking. Setup at 6 AM, doors open at 8 AM. VEC testing 9 - 12. For Information contact LAMARSFEST, 650 Green Bay RD, Lake Bluff, IL 60044. (Small fest, but usually interesting - AJ9S.)

APRIL 1997

Apr 13 (Sun), Chicago, IL - CARC Ham Auction. DeVry Tech, 3300 N. Campbell Ave. Will auction your electronic goods at this auction if you bring them in before 12 noon. All goods subject to 10% donation. If purchased back by the sell, then 5% will be due. All sales as-is and final. Info: Dean (708)331-7764 or George (312)545-3622, days.

Apr 19 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Apr 20 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Apr 27 (Sun), Arthur, IL - Moultrie ARK. Contact Ralph Zancha, WC9V, tel (217)873-5287.

MAY 1997

May 3 (Sat), Cedarburg, WI - Ozaukee Radio Club Swapfest, 8:00 AM. Circle B Recreation Center, Intersection of HY 60 and Ozaukee Cty I. Talk-in on 146.37/97 and 146.52 $4.00 Amateur License exams. Amateur Radio. Computers. For Information Contact O.R.C. Swapfest Committee, W58 N985 Essex Dr, Cedarburg, WI 53012-1439 or call Gabe at 414-377-2784 between 6:00 and 8:00 PM.

May 4 (Sun), Sandwich, IL - DeKalb KARK Hamfest. Sandwich Fairgrounds at Suydam and Gletty Roads. Admission $6. Overnight camping on grounds $10. Talk in 146.73 or 146.52 MHz. Info: Bob Yurs, N9ZNA (815)895-3219 or n9zna@aol.com. Web page: www.tbcnet.com/~jleonard/hamfest.htm (Good, medium sized fest which grows each year. Good restroom facilities. Few commercial exhibitors. - AJ9S).

May 10 (Sat), Peotone, IL - Kankakee Area Radio Society hamfest. Will County Fairgrounds. I-57 to Peotone exit 327 (east). 6 AM. Admission $4. Talk in 146.94 MHz. Info: Willis Bowser, K9IFO (815)472-2079.

May 18 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

May 25 (Sun), Chicago, IL - Chicago ARC. DeVry Tech, 3300 N. Campbell Ave. Admission $5. Info: (312)545-3622 or (312)486-6823.

May 31 (Sat), Springfield, IL - The Sangamon Valley Radio Club. Illinois State Fairgrounds. This Hamfest is "rain or shine" with over 100,000 square feet of covered and lighted fleamarket space, plus indoor facilities. Info: Don, W9EBK at 217-789-4519.

JUNE 1997

Jun 1 (Sun), Princeton, IL. Bureau County Fairgrounds. Free parking. Info: Debbie Burton, N9DRU, 1153 Union St., Marseilles, IL 61341-1710, tel. 815-795-2201 (Usually an excellent hamfest, with sellers from Illinois, Iowa, and Wisconsin. - AJ9S.)

Jun 8 (Sun), Wheaton, IL. Six Meter Club of Chicago. DuPage County Fairgrounds, 2015 Manchester Rd. 7 AM. Admission $5. VEC tests 9 AM - 1 PM. Talk-in on 146.97 MHz (107.2 PL) or 146.52 MHz. Info (708)442-4961 or contact Joe Gutwein, WA9IRJ, (630)963-4922.

Jun 8 (Sun), Orland Park, IL - Giant Computer show, Orland Park Civic Center. See notes at the end of this article.

Jun 22 (Sun), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

JULY 1997

Jul 13 (Sun), Sugar Grove, IL - Fox River Radio League, Waubonsee Community College, Rt 47 at Harter Rd. 6 AM. Admission $5. VEC tests 10 AM only. Talk in 147.21 (pl 103.5 & 107.2 Hz) Info: Diana, WD9API (630)293-7485.

Jul 26 (Sat), Pecatonica, IL - Rockford Amateur Radio Assoc. (RARA) Amateur Radio and Computer Hamfest. Winnebago County Fairgrounds, about 15 minutes west of Rockford, Il. Talk in on 146.61 MHz, 114.8 Hz PL. This will be in the main exhibition hall with room for tables. Ham Radio Vendors, Computer parts vendors, tailgating, food. Code receiving contest, Throw the Radio contest, Great door prizes. For table reservations contact Mike Anderson at (815)397-4304 or mander5@ix3.ix.netcom.com. For any other information contact Marsha Plasters at (815) 399-9233 or wa9ffl@aol.com.

AUGUST 1997

Aug 16 (Sat), Franklin, WI - 7:00 AM, C.A.R.S. Crystal Ridge Ski Lodge. Talk-in on 442.200+ pl 100.0 / 146.52 simplex $4.00/$5.00 Radios. Computers. Electronics. Concessions. Door Prizes. Free parking. Free camping. Large Tailgate selling area. Electricity available, $1.00. Contact C.A.R.S., PO Box 325, Franksville, WI, 53126-0325. 414-325-7427

Aug 16 (Sat), Wheaton, IL - Giant Computer show, DuPage County Fairgrounds. County Farm & Manchester Rds., Wheaton, IL. See notes at the end of this article.

Aug 24 (Sun), Woodstock, IL - Tri-County Radio Group. McHenry County Fairgrounds, Rt. 47. 6 AM. Admission $5. Talk in 146.52 MHz. Contact Bob Grosse, N9KXG. Info (voice/fax) (847)658-1678. http://www.angelfire.com/il/tcrg/ (Smaller, but fun fest. - AJ9S)

SEPTEMBER 1997

Sep 27 and 28 (Sat & Sun), Grayslake, IL - CFMC's Radio Expo 97. Lake County Fairgrounds, Rts 45 & 120. Admission $6. Talk in 146.76 MHz. Info (708)457-0966. (This is probably the biggest and best hamfest in N. Illinois - AJ9S).

NOVEMBER 1997

Nov 15 & 16 (Sat & Sun), Fort Wayne, IN - Fort Wayne Hamfest. Indiana ARRL State Convention. Allen County War Memorial Coliseum Expo Center. Sponsored by the Allen

County AR Technical Society. Admission $5. Parking $2.
www.pipeline.com/~dagagnon/. Info: (219)484-1314.

NOTES - Computer Central and Giant Computer shows

Computer Central computer shows are held at the College of DuPage, Main Arena of the Physical Education Building Park Blvd & College Road, Glen Ellyn, Il. 708-940-7547. $5 admission with card, normal admission $6.00. Opens 9:30 am - 3:00 pm.

Giant Computer shows are usually held at the Orland Park Civic Center, 147th St. & LaGrange Rd., Orland Park, IL or at the DuPage County Fairgrounds, County Farm & Manchester Rds., Wheaton, IL. Admission is $5. Show hours are 9:30 AM - 3 PM. To get on the mailing list or get more information, call (708)974-3123.

Gee Drew, I know several (OK about 40) freebanders in this area and NONE of them use amateur equipment. The radio of choice is the Galaxy (either Saturn or 88). These are export radios and will not go any higher than about 300 Hz. into the 10 meter band. These are "export" radios and are not legal in the US. Modified Cobras run a close second and three or four use modified Trams. Amplifiers run from Elkins to Maco's to Varmants and Texas Star's for mobile use. No amateur amps...they cost three times as much per watt.

Now you may wonder why that is? It all boils down to economics. You can set up a really good freeband station capable of better than 1000 watts for about $500 to $800. To use ham equipment cost's at least twice as much. You have to get it modified and it has all those buttons that they don't know how to use.

I know most of these guys personally and none of them have a ham license. So to call them bootleg hams would be a real stretch. They do all (with the exception of one) talk on CB though. He is a true freebander and uses a modified Tram with a 10 tube Elkin. He's been on one "channel" for the last 5 years.

> as their main calling channel if the government was active there, do you?

Well, I'm located in North Carolina and I did hear a real interesting conversation between two freebanders and the US Border Patrol in Texas last year on FM. So far as them using 27.555 as a calling frequency goes, they realize that the chances of them being caught are very low and quite frankly aren't worried about being caught. In the six years that I have known these guys, no one has ever receive a "Notice of Violation" so I can't really argue with their perception as being false.

> the formalness and "stuffyness" of amateur radio. They have no interest
> or desire to converse with ham operators on 10 meters.

That has not been my experience with them. I have talked to them about getting a ham license and always get two reasons why they won't do it. Number one reason is....their radios won't work on any ham frequencies without modification and they don't want the extra expense. The few who don't use that excuse have bought the book and can't learn the theory. Code has never been an issue and I have talked to quite a few of them in this area about becoming legal.

The only freebanders that I have heard on 10 meters were truck drivers going down the interstate and we both know how hard they are to catch. They were in beacon/cw portion of the band, but of course they didn't know it. You know they were just on channel 40 of the "H" band on the radio. Don't bother them with all that frequency stuff... The base stations here know that if they begin using the 10 meter band that those nasty old hams are going to turn them in. It may be a bluff and it may not, but it keeps them off 10 meters. It does explain why they don't want to talk to hams though.

"The formalness and stuffyness of amateur radio"? One day you are posting about the "Zoo" and the next day you are posting about "formalness and stuffyness". Which is it? It certainly can't be both ways
>

> on here tar and feather me as if I were Satan himself.

Well Drew, just based on the adjectives that you have used in this post and others on the topic, you seem to have nothing but the most respect for those brave souls who are technically competent and brave the remote possibility of fines/imprisonment to engage in meaningful communications and be free of the stuffiness and formalness of ham radio. If you were quoting the magazine article, I didn't see any quotation marks or disclaimers. Sounds like hero worship to me!

>
> It's just a hobby...

When you buy a receiver and spend hours listening to ham frequencies that you can't use so that you can whine about it in the newsgroups and make .wav files, it goes way beyond a hobby. Have you ever looked up "fixation" in the dictionary?

>

> Check out my SEVENTIES Web site at http://167.142.101.43/drew/
>

ENDNOTE: This is a little off topic Drew, but I just really don't feel like making two posts and this does pertain somewhat to what I've said. I have made a couple of posts in the amateur.misc newsgroup supporting the no code stance. I wish to publicly retract that position.

Any requirement (code or theory) that will keep you and Mr. Wilkerson off of frequencies, I am now in favor of. I've warmed up my copy of Supermorse and will not be back on the radio newsgroups until I have upgraded to at least "General". You and he did more to convince me than any General-Extra class operators could ever have done!

Don't bother to respond...I'll be studying code for the next few months.

Greetings!

Navigator 3.0 does not have killfile capabilities, although we are
developing it in the upcoming Communicator release.

I hope this helps. If not, please respond quoting this entire message or
call us at 1-800-320-2099. You can also check out our online help pages at
http://help.netscape.com.

Thank you for using Netscape!

I looked over the proposal in the March QST carefully and didn't see
anyplace where ARRL had proposed increasing the present requirements.
:-)

I also do not believe that anyone with ARRL, nor any pro-coder, has
offered that code proficiency is THE measure of a good ham; I believe
that this post are the only place I have seen it.

4857. GB2RS News 2nd March 1997

Newsgroup: rec.radio.amateur.misc
Date: 1997-02-28 00:00:00 UTC
From: "Dave {Reply address in.sig}" <noone@llondel.demon.co.uk>
Message-ID: <857179190snx@llondel.demon.co.uk>
Source record: 203408
Cross-posted to: uk.radio.amateur,rec.radio.info,rec.radio.amateur.misc

Good morning. It's Sunday the 2nd of March and here is the GB2RS news broadcast, prepared by the RSGB and intended for all radio amateurs and short-wave listeners.

At the RSGB National VHF Convention on the 16th of February, the RSGB Microwave Committee awarded the Cyril James, G3VVB, Memorial Trophy to Chris Whitmarsh, G0FDZ, for his superbly-constructed dual-band 47 and 76GHz transverter. The runner-up was Mr K Vickers, G3YKI, with a 10GHz omni-directional antenna for mobile operation. This uses non-resonant holes as the radiating elements, on opposite sides of a waveguide-tuned cavity, instead of the more conventional narrow slots.

Next weekend, one of the RSGB's major HF contests takes place. It is the Commonwealth Contest, and this year is the 60th Anniversary of this event. The Diamond Anniversary RSGB Commonwealth Contest takes place from 1200UTC on Saturday the 8th of March for 24 hours. It is a CW-only event and is in the 80, 40, 20, 15 and 10 metre bands. Look for plenty of activity from Commonwealth countries, especially Australia, Canada and the Caribbean area. An article on the 60 Years of the Commonwealth Contest is published in the March edition of RadCom, which was posted to all members of the Society during the week, and the full rules of the contest can be found in the RSGB Contesting Guide in the September 1996 RadCom.

Also next weekend, the 8th and 9th, the London Amateur Radio and Computer Show takes place at the Lee Valley Leisure Centre, Picketts Lock Lane, Edmonton. In addition to the large trade show, the event features an RSGB book stall and membership information stand, a bring and buy sale, lectures, an exhibition station, and RSGB Morse code tests on demand. Don't forget to take two passport-size photographs and the appropriate fee with you if you wish to take your Morse test at the Show. New this year is an Internet Cyber Cafe, allowing visitors free access to the Internet. Details of the lectures and a floor plan of the exhibition are published in the March edition of RadCom. Doors open at 10.00am on both days, with priority admission for disabled visitors. For further details please call 01 923 893 929.

The recently-formed Visually Impaired Radio and Electronics Society holds its AGM next Saturday, the 8th of March, commencing at 1.00pm at The Royal National Institute for the Blind, 224 Great Portland Street, London W1. For further details, please call Robert Powell, G7TRT, on 0181 200 7628 during the evening. That number again, 01 81 200 76 28.

The RA has informed the RSGB of the following: 'At Worcester Crown Court on the 12th of February 1997, an individual who was a licensed radio

amateur at the time of the offence pleaded guilty to the charge that on the 22nd of December 1994 he used apparatus for wireless telegraphy except under and in accordance with a licence issued on behalf of the Secretary of State. He was sentenced on the 21st of February to 70 hours community service and ordered to pay 1000 costs. A transmitter, aerial and tapes were ordered to be forfeit.' No further details were made available.

The Polish Scouts Amateur Radio Club based in Hammersmith, West London, is in desperate need of a Novice Instructor. There are a total of 14 teenagers who are very keen to become Novice amateurs, but despite trying for some months, they have been unable to find a tutor. If you would be prepared to help please contact Mr Jasinski on 01 81 749 2779. Any amateur who has held his licence for a year or more can become an RSGB Novice instructor. Further details on how to become a Novice instructor can be obtained from Lynnette Ranger, 2E1EKT, at RSGB HQ on 01 707 659 015.

The GB3HZ Repeater Group, which runs the High Wycombe 70 centimetre repeater, is holding its AGM on Friday the 7th of March in the Downley area of High Wycombe. The meeting will also discuss the possibility of a site change for the repeater. All interested are welcome to attend and talk-in will be provided through the repeater on 70 centimetres channel RB7. For further details please contact Peter Hicks, G4KCX, on 01628 819386.

The Newcastle under Lyme Scout Amateur Radio Communications Group is attempting to activate all 46 WAB squares in the County of Staffordshire today, the 2nd of March. The team is operating on 2 metres FM as GX7UQG Mobile. The group is being sponsored by local Scout Groups to raise funds for Scout Air Activities. For further details, please contact Roger Bloor, G7RSM, whose address is correct in the RSGB Call Book.

There is a new 2 metre repeater on the air in North Wales. It is GB3WZ, located near Wrexham, which is now operational on channel R3. RSGB Zonal Council Member for Wales, Paul Essery, GW3KFE, officially switched on the repeater at 1100 hours on the 14th of February, and made the first call through the new repeater. A 70 centimetre repeater at the same site, GB3RC, is due to become operation on channel RB9 shortly. For further details, please contact the group's Treasurer, Malcolm Bobby, GW0WZZ, on 01978 840675.

Now some items of HF DX news from the weekly RSGB DX News Sheet, edited by Chris Page, G4BUE:

From Anguilla, Bob Whelan, G3PJT, will be active as VP2EJT from the 6th to the 12th of March, including the RSGB 60th anniversary Commonwealth Contest next weekend.

From Ghana, Andy Chadwick, G4ZVJ, will be active as 9G5VJ from the 6th to the 18th of March, also including the Commonwealth Contest.

And from Sri Lanka, HB9BRM will be active as 4S7BRG from the 3rd of March until at least the end of May.

Next the Rally News:

The Red Rose Rally is taking place today, Sunday the 2nd of March, at Horwich Leisure Centre, Church Street, Victoria Road, Horwich near Bolton. The event features a bring and buy stand and special interest groups. Doors open at 10.30am and talk-in is on 2 metres channel S22.

A reminder that the London Amateur Radio and Computer Show is next weekend, the 8th and 9th of March.

And the Wythall Radio Club rally takes place next Sunday, the 9th of March, at Wythall Park, Silver Street, Wythall, near Birmingham. The event features traders in three halls and a large marquee and a bring and buy stand. Talk-in will be provided on 2 metres channel S22 and for further details please ring 0121 430 7267 during the evening or weekend.

Repeater news next:

The 70 centimetre repeater GB3NT, located near Newcastle upon Tyne, was taken out of service on the 24th of February due to an interference problem. It is not known how long it will be off the air. For further details please contact the repeater keeper, Ken Watson, G4GBF, whose address is correct in the RSGB Call Book.

The Home Counties ATV Group tells us that the GB3HV ATV repeater was turned off on Tuesday the 25th of February because the commercial mast on which the repeater's antennas are mounted is being replaced. It is expected that GB3HV will be off the air for about five weeks. More details from the keeper, Mike Sanders, G8LES, on 01420 563 859.

Now for the contest news:

The ARRL DX SSB Contest is this weekend, the 1st and 2nd of March, and finishes at 2400UTC tonight, Sunday. Brief rules are on page 29 of the February RadCom.

A reminder that the 60th Anniversary RSGB Commonwealth Contest takes place next weekend, for 24 hours from 1200UTC on Saturday the 8th of March. The full rules were published in the RSGB Contesting Guide in the September 1996 RadCom.

The RSGB March 144 and 432MHz Contest is taking place this weekend, the 1st and 2nd, and ends at 1400UTC today, Sunday. The full rules were published in the September 1996 RadCom.

The final session of the RSGB 70MHz Cumulative Contest will take place next Sunday the 9th of March, between 1000 and 1200UTC. The rules are also in the September 1996 RadCom.

SSL has informed the Society that as of last Wednesday morning, the latest callsigns allocated were in the M0 Alfa Victor and M1 Bravo Lima series, and Novice calls in the 2 0 Alfa Papa and 2 1 Foxtrot Quebec

series.

And now the solar factual data for the period from the 17th to the 23rd of February 1997, compiled by Neil Clarke, G0CAS.

Solar flux remained steady and averaged 73. The 90-day solar flux average on the 23rd was 77, the same as last week. X-Ray flux averaged A1.2 units, but did increase slightly on the 19th and 20th in response to a C-class solar flare on the 19th and several low-intensity C-class flares on the 20th. Geomagnetic activity started the period at 'unsettled' but then declined to 'quiet' for the remainder of the time. The average was Ap 8. The solar wind speed increased from 270 to 590 kilometres per second data between the 10th and 18th. Particle densities varied between 3 and 16 particles per cubic centimetre, but on the 6th, 7th and 11th were up to 30.

Now the ionospheric data for Central France for the period from the 14th to the 20th of February. The F2 daytime critical frequencies averaged 6.3MHz, but on the 17th were down to only 5.7MHz. The 14th was the best day, with 7.1MHz. The darkness hour lows declined from 3.0MHz on the 15th to 2.3MHz by the 19th and averaged 2.8MHz. The daytime highs took place between 1500 and 1600 hours up to the 16th, and then between 1100 and 1300 from the 17th. The darkness hour lows took place at 0600 hours every day, except on the 18th when they occurred at midnight.

And lastly the solar forecast. This forecast is produced mainly by using the past solar rotational method. Unfortunately, during the solar minimum period, active regions tend to be short-lived which makes forecasting that much more difficult. Activity has been building on this side of the sun over the last two rotations and therefore this week the more active side of the sun is expected to be looking our way. Solar activity may well increase to 'low' levels on some days. However, it is possible that activity has declined and that activity will continue to be at 'very low' levels. Solar flux is expected to be around 80 or slightly above. Geomagnetic activity should be mostly 'quiet' for the first half of the week, but activity is expected to increase towards next weekend. MUFs during daylight hours are expected to be about 19MHz for the south and 16MHz for the north. Darkness hour lows are expected to be about 9MHz.

And that's the end of the solar information.

For more on Propagation see http://www.rsgb.org/society/psc.htm.

THAT is a cheap shot. Many hams can't spell either. Spelling also isn't readily apparent when you are communicating by VOICE.

>
> 2) You talk strangely, with old bad habits still in evidence in many cases,
> like using a form of Ebonics, such as saying things like "The personal here

> them to make the full transition to amateur radio and stop behaving like CB
> operators once they get on the amateur bands?

Im other words, instead of saying things like "seventy thirds", "we're on the side", and "personal", hams would rather hear "Fine business", "we're destinated (who knows where that came from)" and "hi hi".

Lingo prejudice. This is the most ridiculous thing I have seen yet, but all the more rampant.

There is an alternative, use PLAIN ENGLISH! I have no trouble jumping between CB and ham because I talk the same on both. You won't hear either a "10-4" or a "fine business" out of my mouth. I talk to people as if they were standing in front of me.

Hello, I am just starting to get into Amateur Radio and I am looking for
any information that would be good for starters. If you know of any
websites, news groups, e-mail mailing lists, books, etc. that can help
me get a foot in the door of what seems to be a very exciting hobbie let
me know. My boss is really into Amateur Radio so I have a good resource
here, but I thought I would see if I could find anything else. Thanks
in advance.

Carl you're absolutely right, and we even have an HF band available now
for them... 27mhz a band ideally suited for the no-coders. I guess other
privileges could be granted, like higher power (say 500 watts) and
because they are (by law) hams, not even require crystal control.
ha ha ha ha ha ha ha,
It looks like it won't happen this ITU year...
73, and good luck learning13 wpm if you want to operate HF in '98.

Yeah, but then again, how many kids get into ham radio in the first
place? It's kind of boring, and Nintendo doesn't take any studying at
all. And judging from the local rock gym, many find that more
interesting than ham radio too. I wonder how many kids ask for
walkie-talkies for their birthday instead of a new video game
cartridge? I guess when you get right down to it, ham radio and CB is
obsolete.

DId you read the materials?

Many serious RC hobbyists do use amateur frequencies for remote control. Maybe before you spout off, you ought to take a minute to think and do a little research.

Someone could get the wrong impression from CBers from you.

<5f8ocf$7n7@news.Hawaii.Edu>...
>
> Hi Carl - At age 15, after being cited by the Orange County Sheriffs
> for riding a dirt bike on a residential street (no license), I was
> taught something by the judge: Ignorance of the law is no excuse.

Not in the eyes of the law, agreed, but it may provide a reasonable
explaination of the reasons the problem exists and a clue to how to
tackle the problem ... persuading the Mexican goverment (Secretaria
de Comunicaciones y Transportes is the agency like our FCC ...
but Secretaria de Pesca (fisheries) might well be a better way to reach
the fishermen ...) to do a little educating on the topic and even attempt
to provide some enforcement is a more productive tack than simply
characterizing Mexicans as disorderly, rule-flaunting drunkards ...
which is not *quite* what *you* did, but your original post on the subject
appeared to lean in that direction a bit and could serve as s springboard
for further comentary in that direction by those amongst us which
fewer social skills and more tendency to bigotry...

> Yet, I'm not so sure those fishermen were ignorant of the proper use
> of 2182 kc - we'd periodically copy a "mayday" from them on that freq'y
> so someone must have told them it was an emergency channel.

Oh, as I said, I'm sure they've all been told "listen/call here when "it"
hits the fan" ... but they may not have been told that it's not to be used
as a generall calling and chit-chat channel ... many may simply not
understand the way that particular channel is *special* ... beyond
the fact that *everbody* and his brother listens there ...

> I remember now that your wife is Mexican - I didn't mean to offend
> her or anyone else from Mexico; my remarks concerned just the singing
> fishermen on 2182.

I didn't take it like you were trying to be as offensive as Drew's
comments of late ... I just felt some additional comment
might give a broader perspective on the causes of the problem
(and I acknowledge that it *is* a problem)

> (Oh no - I see I used "kc" above - now you'll call me a retro-
> technocrat or some other such nonsense!)

Well, you *are* aren't you? ... you're one of those beepers
that insists on forcing everyone to learn Morse code <grin>

Not in the eyes of the law, agreed, but it may provide a reasonable
explaination of the reasons the problem exists and a clue to how to
tackle the problem ... persuading the Mexican goverment (Secretaria
de Comunicaciones y Transportes is the agency like our FCC ...
but Secretaria de Pesca (fisheries) might well be a better way to reach
the fishermen ...) to do a little educating on the topic and even attempt
to provide some enforcement is a more productive tack than simply
characterizing Mexicans as disorderly, rule-flaunting drunkards ...
which is not *quite* what *you* did, but your original post on the subject
appeared to lean in that direction a bit and could serve as s springboard
for further comentary in that direction by those amongst us which
fewer social skills and more tendency to bigotry...

> Yet, I'm not so sure those fishermen were ignorant of the proper use

> so someone must have told them it was an emergency channel.

Oh, as I said, I'm sure they've all been told "listen/call here when "it"
hits the fan" ... but they may not have been told that it's not to be used
as a generall calling and chit-chat channel ... many may simply not
understand the way that particular channel is *special* ... beyond
the fact that *everbody* and his brother listens there ...

> I remember now that your wife is Mexican - I didn't mean to offend
> her or anyone else from Mexico; my remarks concerned just the singing
> fishermen on 2182.

I didn't take it like you were trying to be as offensive as Drew's
comments of late ... I just felt some additional comment
might give a broader perspective on the causes of the problem
(and I acknowledge that it *is* a problem)

> (Oh no - I see I used "kc" above - now you'll call me a retro-
> technocrat or some other such nonsense!)

Well, you *are* aren't you? ... you're one of those beepers
that insists on forcing everyone to learn Morse code <grin>

Anyone know of an archive of *.rdf files for Yaesu's ADMS system? Yaseu reps ask for a dump from your radio at hamfests, but I've never seen any posted anywhere. I've collected NYC, Los Angeles, Portland Maine and Dayton if anyone wants them Mail to bhughes@intercall.com.

George:

I have a Nissan Quest (a twin to the Villager.) I also looked at the tape storage compartment but my radio would not fit. I wanted to keep to the concept of no drilling or cutting to preserve the value.

After searching around the driver area and doing a lot of thinking, I found that the seat frame gave me the best mounting point for visability, accessability and no drilling. And, in my van at least, there was a power supply under the seat that was alway hot.

What I visioned and eventually did was to mount an aluminum plate to the bottom of the driver seat frame. This would be on the right side of the driver seat as you sit. The plate extends out the small gap between the carpet on the floor and the plastic cover on the frame. The plate is bent to extend up along the side between the floor and the seat cushion. The mounting bracket for the radio is secured to this plate.

The frame (at the floor between anchor points) has a small space that you can slide your finger under (seen from under the seat.) I noticed (by feeling in the space) there were existing holes in the frame. Great! No drilling on the car. After careful measuring, cutting and bending the plate, holding it in place while marking through the holes on the frame, and drilling the mounting holes on the plate, I finally secured the plate with two short bolts.
